CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

LIBRARY U. OF I. URBANA-CHAMPAIGN

VOLUME 9, NUMBER 1
JANUARY 1, 1976

W76-00001 -- W76-00500

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

LIBRARY U. OF I. URBANA-CHAMPAIGN

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY U. OF I. URBANA-CHAMPAIGN

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SIMULATION OF WATER-AND VAPOR-DOMINATED HYDROTHERMAL RESERVOIRS,
Geological Survey, Reston, Va.
J. W. Mercer, and C. R. Faust.
Preprint of Paper SPE 5520, prepared for 50th Annual Fall Meeting, September 28-October 1, 1975, Dallas, Tex: Society of Petroleum Engineers of AIME Preprints, 1975. 16 p, 5 fig, 2 tab, 35 ref.

Descriptors: *Hydrothermal studies, *Reservoirs, *Model studies, *Water vapor, *Thermal water, Flow characteristics, Numerical analysis, Differential thermal analysis, Steam, Energy transfer.
Identifiers: *Geothermal reservoirs, *Thermal energy.

A two-dimensional (Areal), two-phase (Steam-water) model for the numerical simulation of both water-and vapor-dominated hydrothermal reservoirs describes transport of heat and flow of compressed water, steam-water mixtures, and superheated steam in a porous medium. The continuity equations for steam and for water are combined and, assuming that capillary pressure is negligible and that conditions of local thermal equilibrium prevail, are reduced to two nonlinear partial differential equations in which the dependent variables are fluid pressure and enthalpy. The mass transfer (Vaporization) terms are also eliminated when the continuity equations are combined. The two partial differential equations are solved simultaneously using a Galerkin-finite element technique for the spatial terms and finite-difference techniques for the temporal terms. The model is applied to example problems consisting of a hypothetical hot-water reservoir and a hypothetical two-phase reservoir. Model calculations are compared with calculations from other numerical work involving a finite-element model that is restricted to the flow of compressed water, and a finite-difference model that is restricted to the vapor-pressure curve (Steam-water mixtures). This numerical model can be used to evaluate both types of reservoirs. (Woodard-USGS)

A MATHEMATICAL MODEL FOR FORECASTING THE FLOW OF THE SOLA RIVER,
Gdansk Technical Univ. (Poland).
E. Bobinski, T. Piwecki, and J. Zelazinski.
Hydrological Sciences Bulletin, Vol 20, No 1, p 51-60, March 1975. 5 fig, 2 ref.

Descriptors: *Model studies, *River forecasting, *Hydrograph analysis, Streamflow, Rainfall-runoff relationships, Optimization, Computer models, *Mathematical models.
Identifiers: *Sola River(Poland).

A rainfall-runoff conceptual deterministic model with lumped parameters simulating a runoff hydrograph of a mountainous river, having a catchment area of 780 sq km, was brought into service in 1973. The input consists of the rainfall amount and river flow values in the catchment area recorded on gauges every 3 hours for the previous 24 hours, and the quantitative precipitation forecast (QPF) for the next 24 hours. The output results are forecasted hourly values of river flow for the next 48 hours, given in three variants corresponding to the three following variants of the QPF: P sub 1=0; P sub 2=Pmax; P sub 1 less than P sub 3 less than P sub 2, where P sub 3 is given for input by the forecast meteorologist on duty and P sub 1 and P sub 2 are constants. The forecast refers to 24 hour precipitation total, the mean value for the catchment area. The forecast hydrograph is computed by the odra-1204 computer, with machine time of 8-15 minutes. Input and output data transmission are by teletype line. The identification of model parameters, the practical application of the model, and the results obtained were discussed. (Lardner-ISWS)

WATER BALANCE AND WATER RESOURCES IN CHINA,
Nanyang Univ., Singapore.
K-Y. Chen.
The Geophysical Magazine, Vol 37, No 2, p 519-522, December 1974. 7 fig, 6 tab, 19 ref.

Descriptors: *Water balance, *Water resources, Precipitation(Atmospheric), Climatology, Climates, Monsoons, Precipitable water, Water vapor, Arid lands, Humid areas, Arctic Ocean, Pacific Ocean, *Reviews.
Identifiers: *China, *Siberia, Convergence field, Mold rain, Plum rain, Abnormal precipitation, Aleutian low.

The problems of water balance and resources in Monsoon China from the viewpoint of climatology were reviewed, based on the papers which have been published in China. The following subjects were included: climatology of precipitation in China; the monsoon and precipitation in China; distribution of precipitable water over China; the transport of water vapor over China; the convergence field of water vapor over eastern China; Mei-yu (mold rain or plum rain) in China; abnormal precipitation in China; and arid and humid regions in China. The paper was a part of group study on water resources of monsoon Asia guided by Dr. M.M. Yoshino, University of Tasukuba, Japan, supported by the Japanese Ministry of Education in 1972 and 1973. MULTIPLICATION OF ICE PARTICLES IN SLIGHTLY SUPERCOOLED CUMULUS,
Manchester Univ. (England). Dept. of Mathematics.
R. F. Chisnell, and J. Latham.
Journal of the Atmospheric Sciences, Vol 32, No 4, p 863-866, April 1975. 10 ref.

Descriptors: *Cloud physics, *Model studies, *Ice, Precipitation(Atmospheric), Rime, Freezing, Clouds, Nucleation, Supercooling, Raindrops, Mathematical models, Meteorology.
Identifiers: *Ice particles, Riming, Splintering, Cumulus clouds.

A stochastic model of ice particle multiplication was outlined in which ice splinters are produced by riming and possibly also by the splintering of individual drops on freezing. The splinters may grow into rimers or be captured by supercooled drops, causing the drops to freeze and become rimers. The possibility of splinter-capture by supercooled drops reduces the average waiting time between the birth of a splinter and its subsequent development into a splinter-producing rimer. This reduction of the waiting time greatly enhances the growth rate of the ice particle population. In a particular calculation, with drops present, a multiplication factor of 10,000 is achieved in about 50 min if M sub p (the number of ice splinters ejected per unit mass of rime) is 1 per mg; this time is reduced to 10 min if we take the much higher values of about 140 found by other investigators. The corresponding times in the absence of drops were about 74 and 37 min respectively. (Sims-ISWS)

MEASUREMENT AND ANALYSIS OF VERY SHORT DURATION RAINFALL,
Asian Inst. of Tech., Bangkok (Thailand).
S. Pinkayan, and T. Ketratenaborvorn.
Hydrological Science Bulletin, Vol 20, No 1, p 87-91, March 1975. 3 fig, 4 ref.

Descriptors: *Rainfall, *Rainfall intensity, *Rain gages, Precipitation(Atmospheric), Frequency curves, Duration curves, Measurement, Analysis, Instrumentation, Meteorology, Climatology.
Identifiers: *Short duration intensities, *Thailand.

Hydraulic structures such as road culverts, bridge openings, and drainage systems of airfields and urban areas need to have an adequate capacity for flash floods. The peak of these flash floods from small catchment areas reach the drainage facilities after a very short duration of rainfall. Therefore, rainfall characteristics are the most important input to be used in estimation and prediction of floods from small basins. One method which can be used to obtain more information about the rainfall intensity is to record rainfall for a shorter time interval. This was done by changing the speed of chart drum from one revolution per day to 24 revolutions per day. The experiment was undertaken for a period of one year. The relationship was found between intensities of shorter durations and longer durations for this period. This relationship was used to estimate the rainfall intensity of short durations from the longer durations observed during the previous years of record. The rainfall intensities for durations of less than 5 minutes determined by the extrapolation of intensity-duration-frequency curves were lower than the rainfall intensities obtained from the combination of the records of previous years. The rainfall intensities for the durations of 1, 2, 3, and 4

LIBRARY U. OF I. URBANA

minutes were less than those obtained from the combined data by 10, 9, 7, and 4 percent, respectively. (Sims-ISWS)

REBOUND LIMITS ON CHARGE SEPARATION BY FALLING PRECIPITATION,
New Mexico Inst. of Mining and Technology, Socorro. Dept. of Physics.
C. B. Moore.
Journal of Geophysical Research, Vol 80, No 18, p 2658-2662, June 20, 1975. 4 fig, 3 tab, 12 ref. ONR N00014-67-A-0267-0009, NSF GA-43933 and GA-33372X2.

Descriptors: *Cloud physics, *Thunderstorms, *Hail, *Raindrops, Precipitation(Atmospheric), Crystals, Ice, Clouds, Model studies, Mathematical models, Laboratory tests, Meteorology.
Identifiers: *Charge separation, *Cloud electrification, Hail pellets, Particle collisions, Collision angles, Rebound probabilities.

Neglect of the sample dependence of rebound probabilities for cloud droplets colliding with hail pellets has led to an overestimate of the amounts of charge that can be separated with the Elster-Geitel mechanism. Application of wind tunnel results suggested that the actual amounts of charge transferred may be less than 20% that assumed by ignoring the angle dependence. Observations of the charges carried by hail and rain particles within the bases of thunderclouds supported these lower estimates and raised questions about the adequacy of the precipitation processes in explanations of thundercloud electrification. (Sims-ISWS)

REGIONAL DISTRIBUTION AND SEASONAL CHANGE IN PRECIPITATION VARIABILITY IN MONSOON ASIA,
Mie Prefectural Univ., Tsu (Japan).
M. Mizukoshi.
The Geophysical Magazine, Vol 37, No 2, p 175-184, December 1974. 4 fig, 26 ref.

Descriptors: *Monsoons, *Asia, *Rainfall, *Tropical regions, Variability, Rainfall disposition, Distribution patterns, Precipitation(Atmospheric), Seasonal, Pacific Ocean, Indian Ocean, Meteorology, Climatology.

Regional distribution of the precipitation variability and their seasonal variation were discussed for Monsoon Asia. Variabilities of annual and monthly precipitation were computed for 177 stations on the basis of the data of monthly and annual precipitation for the period 1931-1960. The area studied extends from 60 E to 180 E and from 10 N to 50 N. Major results were: (1) there are some regions in which the precipitation variabilities are very large or very small. For example, in most of the Indian Subcontinent and its surroundings, the variability of monthly precipitation exceeds 100%, except for the period June-August. In contrast, the equatorial areas and East Asia receive relatively constant precipitation; (2) distribution patterns of the precipitation variability change gradually from month to month. There are no abrupt seasonal changes in the pattern; (3) monthly distribution maps of variability show zonally extended patterns. Some zones of maximum and minimum variabilities were recognized. Drawing the axes of maximum and minimum variabilities, monthly positions of the axes were shown; (4) the zones of minimum variability coincide with ITCs and the Pacific polar frontal zones; and (5) the zones or axis of maximum and minimum variabilities shift their positions seasonally. (Sims-ISWS)
W76-00016

INTERANNUAL FLUCTUATIONS IN THE RAINFALL OF THE INDIA-EQUATORIAL PACIFIC REGION AND IN THE TROPICAL CIRCULATION,
Meteorological Research Inst., Tokyo (Japan).
I. Tsuchiya.
The Geophysical Magazine, Vol 37, No 2, p 163-173, December 1974. 8 fig, 1 tab, 13 ref.

Descriptors: *Monsoons, *Air circulation, *Tropical regions, *Rainfall, *Asia, *Indian Ocean, *Pacific Ocean, Circulation, Winds, Atmosphere, Precipitation(Atmospheric), Rainfall disposition, Variability, Wet seasons, Meteorology, Climatology.

As a result of analysis of the year-to-year variations of the winds at Mauritius Island in the Indian Ocean and at Canton Island in the Pacific Ocean during the period of 1962-1967, it was found that the strengths of southeast trade winds over the two oceans fluctuate in phase. The monsoon rainfall over the western slopes of the Indian Peninsula is plentiful in a year of strong southeast trade winds, while rainfalls of the islands in the equatorial Pacific dry zone are scanty. In reverse, we find drought weather over India and anomalous heavy rainfalls in the dry zone in a year of weak southeast trade winds. The Walker Circulation named by Bjerknes is a circulation model which explains large-scale rainfall distribution. (Sims-ISWS)

A STUDY OF EXTREME POINT RAINFAL OVER FLASH FLOOD PRONE REGIONS O THE HIMALAYAN FOOTHILLS OF NORT INDIA,
Institute of Tropical Meteorology, Poona (India).
O. N. Dhar, A. K. Kulkarni, and R. B. Sangam.
Hydrological Sciences Bulletin, Vol 20, No 1, 61-67, March 1975. 1 fig, 1 tab, 10 ref.

Descriptors: *Probable maximum precipitatio *Precipitation intensity, *Maximum probab flood, Precipitation(Atmospheric), Design floo Flood data, Flash floods, Estimating, Rainfa Cloudbursts, Rain, Precipitation exces Meteorological data, Hydrologic data, Weath data, Meteorology.
Identifiers: *India, Himallayan foothills, Extren rainfall.

In north India flash floods normally occur in t foothill and sub-montane regions of the Himalay during the monsoon months due to incidence heavy falls of rain. An attempt has been made estimate extreme rainfalls (Also called probab maximum precipitation) for stations in and ne the Himalayan foothills and sub-montane regio for longitude 75 E to 90 E. Only those stations the foothill regions with unbroken records of da rainfall for 60 to 70 years were selected. Hers field's latest statistical technique was used, a values of the frequency factor in the extreme rai fall equation for individual stations were obtain from the north Indian data. It was found that alo the Himalayan foothill regions extreme 1-day ra fall varies from 850 to 340 mm. The highest 1-d extreme rainfall of 850 mm was obtained for t Nagla station in the Nainital district in the K maon Hills, while the lowest value of 340 mm w obtained for the Kulu station in Kangra district Himachal Pradesh. It was also observed that t extreme rainfall is quite high in the outer footh regions of the Himalayas and decreases sharply one moves into the interior of the Himalayas. F the Himalayan foothill region under study, t ratio of the extreme 1-day rainfall to the highe observed 1-day rainfall over a period of 60 to years was found to be of the order of 2. (Sim ISWS)

THE MEASUREMENT OF HEAVY RAINFA OVER SMALL CATCHMENTS USING RADAR
British Meteorological Office, Brackn (England).
T. W. Harrold, C. A. Nicholass, and C. G. Collie
Hydrological Sciences Bulletin, Vol 20, No 1 69-76, March 1975. 7 fig, 1 tab, 2 ref.

Descriptors: *Rainfall, *Measurement, *Rad *Remote sensing, Rainfall intensity, Rainf disposition, Hydrologic data, Meteorological da Watersheds(Basins), *Small watersheds, Calib tions, Instrumentation, Meteorology.
Identifiers: *North Wales.

It was shown that radar-derived estimates heavy localized rainfall over sub-catchments area 20-100 sq km in hilly terrain in North Wa differ from optiumum estimates, based on d from a network of raingages, by an average 13% a calibration gauge is located within the su catchment of interest, or by 38% if there is calibration gauge--the average calibration from 18 month period being used instead. In order make accurate measurements over very sm areas (A few sq km), the radar should be wit about 35 km of the area of interest so that errors

the estimates of surface rainfall resulting from the horizontal movement of the rain as it falls from the radar beam to the ground are minimized. The radar system used in this study is now being modified so that data can be processed on site and transmitted in near real time to a nearby river control center. (Sims-ISWS)

SOME SMALL-SCALE CHARACTERISTICS OF EXTREME STORM RAINFALLS IN SMALL BASINS,
Agricultural Research Service, Beltsville, Md.
D. M. Hershfield.
Hydrological Sciences Bulletin, Vol 20, No 1, p 77-85, March 1975. 10 fig, 3 ref.

Descriptors: *Rainfall, *Storms, Time series analysis, Hydrology, Rainfall intensity, Watersheds(Basins), United States, Precipitation(Atmospheric), Precipitation gages, Precipitation intensity, Isohyets, Mapping, Correlation analysis, *Small watersheds.
Identifiers: *Rainfall pattern, Isochronal maps, Extreme rainfall.

Rainfall data from several flood-producing storms are used to illustrate some of the rainfall patterns in both time and space that have been observed. The data are from agricultural basins that vary in size from less than 1 to 1000 square miles and cover the climatic spectrum of the United States. The recording-raingage density varied from 13 per square mile in the smallest basin to 1 gage per 9 square miles in the largest basin. Storm isohyetal maps and isochronal maps of storm beginning times portrayed the complex areal patterns that are associated with extreme rainfalls. Cross-correlations and the mean of successive differences from series of short-duration rainfall increments, based on data from combinations of nearby stations, provided measures of time and areal variability. The series were composed of 2, 5, 10, 15, and 60-min rainfall increments. The largest observed storm rainfall differences over the shortest distances, based on a sample of 400 storms from 20 basins, ranged from 1 in for raingages separated by 0.1 mi to 8 in for gages separated by 9 mi. (Lee-ISWS)
W76-00301

A REPRESENTATION OF THE EFFECTS OF TOPOGRAPHY ON SURFACE RAINFALL WITHIN MOVING BAROCLINIC DISTURBANCES,
British Meteorological Office, Brackness (England).
C. G. Collier.
Quarterly Journal of the Royal Meteorological Society, Vol 101, No 429, p 407-422, July 1975. 7 fig, 4 tab, 14 ref.

Descriptors: *Rainfall, *Model studies, *Mathematical models, Precipitation intensity, Precipitation(Atmospheric), Orography, Forecasting, Simulation analysis, Rainfall disposition, Rainfall intensity, Rain, Meteorology.
Identifiers: *Baroclinic systems, *North Wales.

A numerical 'parameterization' model has been developed in order to predict precipitation amount over hilly terrain in North Wales. The model enables calculations to be made of the vertical velocity profile resulting from orographic and large-scale baroclinic effects at grid points one kilometer apart over an area of 2400 sq km. The precipitation falling on an area of 1000 sq km, and on areas of order 100 sq km within the larger area was predicted, using as the input to the model large-scale wind and humidity values derived from radiosonde ascents. Seven case studies were presented. All are examples of fast-moving baroclinic systems. This type of system was chosen to minimize the effects of non-orographic mesoscale or convective mechanisms, which are not parameterized in the present model. The mean error in the predicted rainfall over 1000 sq km was + or -10% and over 100 sq km about + or -20%. (Sims-ISWS)

PERENNIAL SNOW COVERS, TINY GLACIERETS AND SNOW FIELDS IN JAPAN AS INDICES OF CLIMATIC FLUCTUATIONS,
Meteorological Research Inst., Tokyo (Japan).
I. Tsuchiya.
The Geophysical Magazine, Vol 37, No 2, p 147-161, December 1974. 12 fig, 1 tab, 15 ref.

Descriptors: *Snow cover, *Glaciers, *Snow surveys, Mountains, Snowmelt, Ablation, Snowpacks, Water resources, Firn, Ice, Snow, Precipitation(Atmospheric), Climatology, Melting, Meteorology.
Identifiers: *Japan.

There are many small but perennial snow covers in the mountains on the Japan Sea side of the Japanese mainland. Some of them survive two or more consecutive summers. Transformation process snow-glacial ice is more rapid than the case in the polar regions, and firn begins to turn into new ice at the end of its first ablation season. The perennial snow covers of snowdrift type may be used as a climatic index since their wax and wane reflect winter snowfalls and summer temperature. The depth of winter snow covers at 1300-1800 m mean sea level on the lee side slopes in some mountains of the Tohoku District often reaches 30-50 m. The survey of these is important in evaluating climatic fluctuations and water resources. (Sims-ISWS)

2D. Evaporation and Transpiration

UPPER CARSON RIVER WATER STUDY, WATER YEAR 1973,
Nevada Agricultural Experiment Station, Reno.
J. C. Guitjens, and C. N. Mahannah.
Report R113, January 1975. 30 p, 9 fig, 2 tab, 14 ref, 7 append.

Descriptors: *Evapotranspiration, *Evaporation, *Soil moisture, *Nevada, Water table, Groundwater, Irrigation, Drainage, Withdrawal, Precipitation(Atmospheric), Rainfall, Temperature, Humidity, Evaporation pans, Measurement, Mathematical models, Agriculture, Water management(Applied).
Identifiers: *Carson Valley(Nev).

Mean annual pan evaporation from three study sites showed a decrease of more than 7 inches (from 63.7 to 56.2 inches) as compared to the previous water year of 1972. Potential evapotranspiration estimated by five theoretical models ranges from 36 inches for the Blaney-Criddle method with a variable crop coefficient to 59 inches for the Jensen-Haise method with a constant crop coefficient equal to one. All five theoretical methods showed increases compared to the previous water year of 1972. Assuming an annual pan coefficient of 0.7 for Carson Valley, the two-year mean of 60 inches of pan evaporation as measured at three sites would estimate an annual potential evapotranspiration of 42 inches. Seven irrigations, precipitation, and subirrigation at the Sarman Ranch produced only 11 inches of measured soil moisture additions; evapotranspiration and deep drainage produced only 21 inches of computed total soil moisture depletion. Presumably, high water tables contributed to a consistently high soil moisture content in the root-zone, a small air volume, and a relatively high use of water-table water for evapotranspiration. A similar but less pronounced phenomenon may have occurred at the Witt Ranch with an intermediate water-table. There were 23 inches of measured soil moisture additions and 37 inches of computed total soil moisture depletion. Evapotranspiration of water-table water could have occurred while the normally low water table was relatively high. The Heritage Ranch showed 37 inches of measured soil moisture additions and 46 inches of computed total soil moisture depletion. (Sims-ISWS)

COMPARISON OF EVAPORATION MEASUREMENTS USING DIFFERENT METHODS,
British Meteorological Office, Cambridge (England). Research Unit.
D. R. Grant.
Quarterly Journal of the Royal Meteorological Society, Vol 101, No 429, p 543-550, July 1975. 2 fig, 1 tab, 11 ref.

Descriptors: *Evaporation, *Barley, *Measurement, Energy budget, Lysimeters, Field crops, Neutron absorption, Anemometers, Rainfall, Radiation, Wind, Shear, Period of Growth, Instrumentation, Reliability.
Identifiers: *Bowen ratio, Aerodynamic method, Energy balance, Neutron moisture meter, Standard deviation.

Continuous measurements by five different methods were made of evaporation from barley during the 1971 growing season. The five methods were: (1) the Bowen ratio method, (2) the aerodynamic method, (3) use of the energy balance equation and the aerodynamic flux to obtain evaporation as the residue (the energy balance method), (4) a weighing lysimeter, and (5) a neutron moisture meter. Estimates were made of the error expected from each method and the results of the measurements were presented. Using the lysimeter and neutron probe as standards, the measurements confirmed that in a field of barley, when the Bowen ratio is usually small, the best method of measuring the daily evaporation throughout the whole growing season is the Bowen ratio method. The energy balance method is almost as good and has the advantage of not requiring humidity measurements. (Roberts-ISWS)

INCLUSION OF PLANT MOISTURE STATUS IN COMBINATION-METHOD ESTIMATES OF PASTURE EVAPORATION,
Commonwealth Scientific and Industrial Research Organization, Aspendale (Australia). Div. of Atmospheric Physics.
W. Shepherd.
Journal of Hydrology, Vol 26, No 3/4, p 199-207, August 1975. 3 fig, 1 tab, 10 ref.

Descriptors: *Evaporation, *Pastures, *Plant physiology, *Moisture, Energy budget, Moisture stress, Soil moisture, Grasslands.
Identifiers: *Pasture evaporation, Internal conductance, Moisture indexes, Penman, Pasture growth, Energy balance.

A combination-type formula for estimation of evaporation under conditions of restricted water supply was considered in earlier work. The formula involved an 'internal conductance' factor. Relationships of the conductance to indexes of moisture status of pasture species, determined over a range of soil-moisture conditions, was described here. Once established, these relationships were employed to estimate conductances, which were then used to determine evaporation over later periods of pasture growth. The investigations demonstrated that inclusion of plant-moisture stress data into a combination formula could afford estimates of pasture evaporation which were significantly better than those obtained by more empirical means. 2E. Streamflow and Runoff

QUANTITATIVE PREDICTION OF SEASONAL RATING CURVE SHIFTS,
National Weather Service, Kansas City, Mo. River Forecast Center.
C. B. Barrett.
Water Resources Research, Vol 11, No 4, p 526-532, August 1975. 7 fig, 4 tab, 15 ref.

Descriptors: *Rating curves, *Temperature, *Discharge(Water), *Missouri River, River beds, Water temperature, Discharge measurement, Streamflow, Stage-discharge relations, Sediments, Seasonal, Regime, Beds.
Identifiers: *Seasonal rating curves, Bed form, Stream width, Linear multiple regression techniques, Monthly rating curves, Low-flow regime rating, High-flow regime rating.

Application of linear multiple regression techniques to discharge measurement and water temperature data collected for selected Missouri River forecast points resulted in development of a successful quantitative technique for prediction of seasonal rating curve shifts. By utilizing 20 yr of discharge measurement and water temperature data for Omaha, Nebraska, and St. Joseph and Kansas City, Missouri, it was found that the addition of the independent variable water temperature to the stage-discharge relationship increased multiple correlation coefficients significantly. In all cases studied, increased temperature reflected an increase in stage for a constant flow. The maximum effect of water temperature was indicated for low flows. Water temperature is thought to cause the alterations of bed form configuration resulting in seasonal rating curve shifts. (Lee-ISWS)

PRECIPITATION CONDITIONS RESULTIN IN FLASH FLOODS AS RELATED TO TH FREQUENCY DISTRIBUTION OF INTERDIU NAL VARIATIONS OF THE SPECIFIC RUNOF IN MINOR CATCHMENT AREAS UNA FECTED BY MAN,
Meteorologischer Dienst der Deutsch Demokratischen Republik, Potsdam.
I. Spahn.
Hydrological Sciences Bulletin, Vol 20, No 1, 93-99, March 1975. 3 fig, 3 tab, 3 ref.

Descriptors: *Rainfall-runoff relationship *Runoff, *Rainfall, Flash floods, Frequen curves, Climatology, Precipitation(Atmospheric Floods, Hydrology, Surface runoff, Durati curves, Watersheds(Basins), *Small watershed Flood flow, Water management(Applied), Runo coefficient.
Identifiers: Small catchments.

The studies were carried out in catchment areas 50 to 150 sq km in the hills of the Germa Democratic Republic above an altitude of 500 The distribution of interdiurnal variations of t specific runoff of the two long-term series records 1916-1935 and 1946-1960 were used for objective selection of flood events of t hydrological summer season. The frequency di tributions of both these periods showed th between 1916 and 1960 there were no substanti variations in the runoff regime of the catchme areas, because of this the flood events under i vestigation were selected only from the second s ries (1946-1960). The related precipitation even have been investigated using precipitati recordings of duration, amount, and type. Floo can be expected in these catchment areas only the areal mean of precipitation exceeds 50 m with the associated duration varying between ju a few hours and three days. The purpose of the investigations was to develop the relation betwe runoff variations and the corresponding associat precipitation events for the period when t catchment areas are not influenced by man. T climatological analysis of the precipitation even may be used as a basis of the optimization of wat resources management and for prevention damage from floods. (Lee-ISWS)

FINITE ELEMENT SIMULATION OF FLOO HYDROGRAPHS,
Virginia Polytechnic Institute and State Univers ty, Blacksburg. Dept. of Agricultural Engineering
O. M. Judah, V. O. Shanholtz, and D. N.
Contractor.
Transactions of the American Society of Agricu tural Engineers, Vol 18, No 3, p 518-522, Ma June 1975. 6 fig, 1 tab, 21 ref.

Descriptors: *Finite element analysis, *Flo routing, *Numerical analysis, Overland flo Flood discharge, Mathematical studies, Mannin equation, Floods, Hydrographs, *Simulation ana ysis.
Identifiers: Kinematic wave approximation.

The distribution of overland flows has been st died extensively; the literature abounds wi discussion utilizing finite difference techniques

solve the unsteady flow equations. Little information is available on the use of finite element methods to solve surface water problems, despite extensive use in solving groundwater flow problems. Finite element techniques were used to develop a method for solving the one-dimensional, unsteady flow equation for overland and channel flows. The momentum equation was replaced by Manning's equation using the kinematic wave approximation. To demonstrate, flood hydrographs from actual watersheds were compared. (Jess-ISWS)

S. M. Marei, and G. D. Towner.
Water Resources Research, Vol 11, No 4, p 589-594, August 1975. 5 fig, 8 ref.

Descriptors: *Model studies, *Seepage, *Groundwater, *Slopes, Aquifers, Groundwater movement, Aquicludes, Dupuit-Forchheimer theory, Water table aquifers, Equations, Height, Ditches, Discharge(Water), Viscosity.
Identifiers: *Hele-Shaw models, *Sloping aquifers, Streamlines.

The analysis derived from an application of the Dupuit-Forchheimer approximations by Childs to the problem of flow of groundwater over sloping impermeable beds, in which it is assumed that the streamlines are parallel to the sloping bed rather than horizontal as previously assumed by Pavlovsky, was tested in a Hele-Shaw analog. Seepage rates and water table positions were measured for a range of slopes up to 30 degrees and with flow both up and down the slope. Considerably better agreement was found, especially at the largest slopes, by using the revised assumption. The theoretical seepage rates calculated from Childs' analysis also lay between the limits given by an exact analysis due to Youngs, in contrast to values calculated by using Pavlovsky's analysis which fell outside the limits for large flow rates. ENVIRONMENTAL IMPACTS OF SALINE SEEP IN MONTANA,
Western Interstate Commission for Higher Education, Boulder, Colo.
M. Harlow.
Montana Environmental Quality Council, Helena. 1975. 95 p, 12 fig, 6 tab, 3 append, 234 ref.

Descriptors: *Environmental effects, *Saline water systems, *Seepage, *Water pollution sources, *Saline water intrusion, Saline soils, Groundwater, Recharge, Discharge(Water), Subsurface drainage, Surface runoff, Drainage, Surface-groundwater-relationships, Air pollution, Montana.

Saline seeps are recently developed saline soils in nonirrigated areas that are wet some or all of the time, are frequently covered with a white salt crust, and where grass production is reduced or eliminated. 140,000 acres of cropland in Montana are already affected by saline seep, and the conditions could possibly affect a total of 17,000 square miles in the state. This report examines the geologic, climatic, and land use situations which have combined to produce saline seep. Of the four components of this condition, recharge, subsurface, discharge, and overland drainage, the last two affect the biosphere via the soil and surface water systems. Impacts of saline seep on ecosystems both at the discharge site and downstream are examined and alternatives for mitigation of the condition are presented and examined for their possible environmental impacts. Appendix material includes activities of the 1975 Montana legislature on saline seep problems in the state. (Michael-Arizona)

PALEOHYDROLOGY OF THE CAVES IN THE MORAVSKY KRAS (MORAVIAN KARST),
Ceskoslovenska Akademie Ved, Brno. Geograficky Ustav.
J. Pribyl.
Studia Geographica 28, Brno, 1973, 64 p, 4 tab, 19 fig, 95 ref.

Descriptors: *Paleohydrology, *Caves, *Geology, *Karst, *Karst hydrology, Limestones, Quaternary period, Sedimentation, Paleoclimatology, Geomorphology.
Identifiers: *Speleology, *Moravian Karst, *Czechoslavakia, Cave sedimentation.

The Moravian Karst is located northwest of Brno, Czechoslovakia. The northern area of the Karst forms part of a belt of Devonian limestones that is 3 to 5 km wide and 25 km long. The geology of the region is explained and the paleogeographical development is described from the Lower Devonian to the present. Study methods include sedimentological, speleological and hydrological research and are reviewed in detail. There is a great variety in the sedimentary fillings of the caves of the Moravian Karst, and these are thoroughly described and divided into facies. The northern part of the Moravian Karst is divided into several regions, among them the Sloup region, the Holstejn region, and the Ostrov region. The individual caves in each area are sedimentologically described in order to determine the development of the cave systems. Three main stages of development in the Quaternary have been distinguished from the sedimentological cycles. (Bradbeer-NWWA)

R. D. Barker, and P. F. Worthington.
Geoexploration, Vol 11, No 3, p 151-170, September, 1973. 18 fig, 1 tab, 22 ref.

Descriptors: *Hydrogeology, *Geophysics, *Seismic studies, *Porosity, *Permeability, *Sandstone, Aquifer properties, Resistivity, Groundwater, *Aquifer characteristics.
Identifiers: *Bunter sandstone, *Seismic velocity, England.

Laboratory investigations of the Bunter Sandstone (a principal source of ground water in the United Kingdom) from the Fylde area of Lancashire have been made including density and porosity, intergranular permeability, electrical resistivity, and seismic velocity. Marked correlations developed between porosity, formation resistivity factor, and seismic velocity. The dependence of intergranular permeability on these three quantities is less well defined but significant. These relations apply specifically to this sandstone in the Fylde area but may be generally applicable to the Bunter sandstone in other areas. The easiest field application of this study is the estimation of sandstone porosity and permeability from seismic velocity. (Bradbeer-NWWA)

SALINE GROUND WATERS IN THE CARBONIFEROUS ROCKS OF THE ENGLISH EAST MIDLANDS IN RELATION TO THE GEOLOGY,
Water Resources Board, Reading (England).
R. A. Downing, and F. Howitt.
Quarterly Journal of Engineering Geology, Vol 1, No 4, p 241-269, June, 1969. 12 fig, 3 tab, 25 ref.

Descriptors: *Aquifer, *Saline water, *Geology, *Saline aquifer, Limestones, Coal, Salinity, Groundwater, Chemistry, Rocks, Carbonate rocks.
Identifiers: *Carboniferous rocks, Coal measures, Millstone Grit, *East Midland(England), Origin, Source, Genesis.

The Carboniferous system in the East Midlands is comprised of a limestone-shale series or a massive limestone (the Carboniferous Limestone) overlain by a cyclic sequence of sandstones, mudstones, seat earths, and coals (the Millstone Grit and Coal Measures). The geology is briefly described and new correlations of the Millstone Grit and the Lower Coal Measures are introduced. Most of the ground water discussed is saline with total concentration ranging up to 246,000 mg/l. The concentration in all formations increases from southwest to northeast and the variation in ionic content associated with this increase is discussed. The ground waters are probably from the diagenesis of Carboniferous marine and brackish waters and possibly some Permian marine waters, most likely concentrated by argillaceous beds acting as semi-permeable membranes. It is suggested that the increase in Ca/Cl and Mg/Cl ratios as the total ionic concentration increases is due to the selective concentration of calcium and magnesium ions by argillaceous beds. In the southwest and south of the East Midlands the saline water has been diluted, probably by meteoric water moving through the aquifers from the outcrop areas and discharging into Permo-Triassic rocks, where these overlie Carboniferous aquifers at depth in the southeast of the region. (Campbell-NWWA)

2G. Water In Soils

SOIL MOISTURE AVAILABILITY AND MOVEMENT,
Nevada Univ., Reno. Cooperative Extension Service.
W. W. Miller.
Report C161, March 1975. 8 p, 6 fig.

Descriptors: *Soil moisture, *Soil water movement, *Moisture availability, *Soils, Saturation, Field capacity, Wilting point, Moisture tension, Storage capacity, Evaporation.

Plants drew water from the soil between irrigations or periods of rainfall. Approximately half of the volume of soil is pore space which may be filled with water or air. The soil properties most important to the water supply of plants are: (1) the moisture storing capacity of soil, (2) the availability of this moisture to plants, and (3) the rate of movement of water into and within the soil. Each of these properties is related directly or indirectly to the size and shapes of soil pore spaces. An introductory explanation of these properties was provided and related terminology was defined. (Sims-ISWS)

Descriptors: *Hydraulic conductivit *Infiltration, *Glacial soils, *North Dakota, Ti Slopes, On-site investigations, Soil water mov ment, Soil water, Tensiometers, Soil physical pr perties, Irrigation, Groundwater movement, U saturated flow, Moisture content, Agronomy.
Identifiers: *Soil water content, Toposequence.

Virtually no information has been published co cerning the hydraulic properties of large acrea of till plain soils associated with 'potholes' northcentral United States and Canada. Obje tives of research were to measure and compare situ hydraulic conductivities and selected s physical properties at several depths in four s profiles on a till plain in southeastern No Dakota. Theoretical hydraulic conductivity valu were calculated and compared with the in situ co ductivities. Unsaturated soil hydraulic conducti ty vs. depth was measured in situ at four sites o toposequence developed from a glacial till. Wa was allowed to infiltrate the soil at each site a the soil surface covered to prevent evaporati During the ensuing drainage periods soil wa pressure was monitored with triplicate tensionm ters at each of six depths. These depths w selected on the basis of soil morphology. S water characteristics, determined on triplicate 7 by 7.6-cm cores taken from the same depth as tensiometers cups, were used in conjunction w soil water pressure data to compute hydraulic c ductivities. Hydraulic conductivity generally creased with depth to about 90 cm. Below t depth, hydraulic conductivity tended to decrea When the matching factor was selected from midpoint of the measured hydraulic conductiv range, the conductivities computed by Green Corey's method compared favorably with th measured in situ. SIMULTANEOUS TRANSPORT OF WAT AND ADSORBED SOLUTES THROUGH S UNDER TRANSIENT FLOW CONDITIONS,
Oklahoma State Univ., Stillwater. Dept. Agronomy.
J. M. Davidson, D. R. Baker, and G. H. Brusew
Transactions of the American Society of Agri tural Engineers, Vol 18, No 3, p 535-539, M June 1975. 4 fig, 24 ref. EPA S-1366, EPA 800364.

Descriptors: *Infiltration, *Solutes, *Adsorpt *Soil water, Soil filters, Model studies, Ma matical studies, Soil water movement, Aque solutions, Pollutants, Water pollution treatm Subsurface waters, Zone of aeration.
Identifiers: Solute transport.

The simultaneous transfer of water and sol through a soil under natural field condition

generally a transient process. The direction and rate at which each of these phases move are dependent upon many factors, including the physical characteristics of the soil, climatic conditions, plant and microbial activity, and interactions between the solute and soil matrix. An understanding of how these pprocesses influence the transfer of each phase is essential in the development of agricultural management practices for minimum contamination to soil and water supplies and the efficient use of irrigation water and fertilizers. A set of differential equations for water and interacting and noninteracting solute transport were solved simultaneously for transient and steady state soil water conditions using a finite difference scheme. The solutions used independently measured soil and soil-solute adsorption-desorption characteristics to describe the movement of a solute in a soil profile. Numerical dispersion in the finite difference solution of the solute transport equation was considered and a correction included in the solution. Experimental results from a laboratory study were used to test the numerical solution's ability to describe the movement and distribution of a herbicide in a soil profile with time. A natural field problem involving infiltration and evaporation was simulated and discussed. The agreement between laboratory and calculated water and herbicide distributions was good. (Sims-ISWS)

CORRELATED CHANGES OF ENZYMATIC ACTIVITY IN SOILS OF VERTICAL ZONES, (IN RUSSIAN),
S. A. Aliev, and D. A. Gadzhiev.
Biol Nauki., Vol 16, No 5, p 121-126, Illus, 1973.

Descriptors: *Enzymes, *Soils, Humus, *Temperature, *Organic matter, *Microorganisms, Sierozems.
Identifiers: Catalase, *Enzymatic activity, Invertase, Phosphatase, Protease, Polyphenol oxidase, *USSR, Nakhichevan ASSR, Chernozems.

The activity of invertase, phosphatase, protease, catalase and polyphenol oxidase in relation to the temperature and water conditions, abundance of microorganisms, and content of organic matter in soils of vertical zones of Nakhichevan ASSR (primitive sierozems, sierozems, and chestnut and mountain chernozems) was investigated. Enzyme activity increased with an increase of the number of microorganisms and content of humus and decreased markedly as soil moisture decreased. The activity of individual enzymes was maximum for different combinations of the temperature and water conditions. The optimal temperature and moisture content of the soils for manisfestation of the activity of the enzymes were, respectively, 12-18C and 18-25% for invertase, 14-20 degrees and 20-30% for phosphatase, 20-25 degrees and 20-25% for protease, 12-18 degrees and 20-25% for catalase, and 18-25 degrees and 15-25% for polyphenol oxidase. A further increase of temperature was accompanied by an increase of the shortage of soil moisture, which caused a marked drop of enzymatic activity. At a low temperature and increase of soil moisture the activity of the enzymes decreased insignificantly.--Copyright 1974, Biological Abstracts, Inc.

Descriptors: *Saline soils, Salts, *Halophytes, Evaporation, Salt marshes, Path of pollutants, Water pollution sources.
Identifiers: *Biological circulation(Salts), *Georgian-SSR, *USSR.

Saline ground waters occuring above the critical level played the leading role in the salinization of soil in the Alazani and other poorly drained plains and drainless depressions of eastern Georgia (USSR). The amounts of readily soluble salts involved in the annual cycle reach an average of 50 to 100 t/ha as a result of direct evaporation and 1.5 to 2 t/ha through halophytes. The biological circulation of salts is of great importance in the salinization of the steppe salt marshes of Kvemo-Kartli and Kakheti. This is confirmed by the analyses of high-ash substances of the overground-and underground parts of halophytes.--Copyright 1974, Biological Abstracts, Inc.

FINITE ELEMENT SOLUTIONS FOR UNSTEADY AND UNSATURATED FLOW IN POROUS MEDIA,
California Univ., Santa Barbara. Dept. of Mechanical and Environmental Engineering.
J. C. Bruch, Jr.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-245 764, $3.75 in paper copy, $2.25 in microfiche. California Water Resources Center, Davis Completion Report, Contribution No 151, August 1975. 25 p, 10 fig, 39 ref. (California Water Resources Center Porject UCAL-WRC-W-336) OWRT A-039-CAL (10).

Descriptors: *Finite element analysis, *Unsteady flow, *Unsaturated flow, *Porous media algorithms, Diffusivity, Infiltration, Soil water, Capillary conductivity, Equations, Numerical studies, Mathematical studies.

A finite element, weighted residual, successive substitution algorithm has been used to solve two-dimensional infiltration problems whose governing partial differential equation and boundary conditions are highly non-linear. The results compared favorably with other published numerical solutions to similar examples. The soil water diffusivity as well as the capillary conductivity, were approximated within a finite element in terms of shape functions and discretized values of these functions calculated using guessed values or previously calculated values at a certain time level of the water content at the nodes. This successive substitution scheme converged rapidly within each time step. The method is general and can be extended to three-dimensional flows and the use of higher order approximations. The nonlinear equations describing the unsteady and unsaturated, one-dimensional flow in porous media have also been investigated. Use was made of the finite element method employing a weighted residual with a linear shape function and two-dimensional elements in space and time. Results were obtained for both traingular and rectangular elements, as well as several forms of the field parameters (capillary conductivity and soil water diffusivity). These results compared very favorably with the results of other investigators who used different techniques for obtaining solutions. (Snyder-California, Davis)

THE EFFECTS OF CLIMATE ON WATER USE IN CANTERBURY IRRIGATION SCHEMES,
Department of Agriculture, Ashburton (New Zealand). Winchmore Irrigation Research Station.
P. D. Fitzgerald.
Technical Report 8, 1974. 20 p, 5 fig, 10 tab, 3 ref.

Descriptors: *Climatology, *Irrigation programs, *Water requirements, *Soil-water-plant relationships, *Moisture deficit, Arid lands, Water utilization, Water conservation, Water management(Applied), Soil moisture, Irrigation practices, Consumptive use, Irrigation water, Precipitation(Atmospheric), Moisture uptake, Moisture content, Water balance, Land use, Droughts, Rainfall.
Identifiers: *Winchmore(New Zealand).

The main form of irrigation is the border method. Water used, irrigation area, land preparation cost, and rainfall data were analyzed to derive average application depths of irrigation water and the percentage of total area for irrigation. Results indicate that average depth of water application is related both to seasonal rainfall and number of drought days. Experiments at Winchmore suggest that the amount of water applied at irrigation is about 3 times that needed to correct the deficit. (Robinett-Arizona)

STEADY VERTICAL FLOWS IN SWELLING SOILS,
Arizona Water Resources Research Center, Tucson.
G. Sposito.
Water Resources Research, Vol 11, No 3, p 461-464, June 1975. 1 fig, 19 ref.

Descriptors: *Expansive soils, *Steady flow, *Porous media, *Evaporation, Expansive clays, Darcys law, Hydraulic conductivity, Permeability, Flow rates, Water table.
Identifiers: *Swelling soils, *Vertical flows, *Steady vertical flows, Isothermal, Isohaline, Steady evaporation, Bare soil.

A thermodynamic description was presented of the isothermal, isohaline steady vertical flow of water in a swelling porous medium. An expression for the rate of steady flow was derived which was a straighforward generalization of well-known results in standard flow theory but which differed considerably from an equation derived previously by Philip to describe the same process. This difference, aside from changes in notation, was shown to be the artifact of an error in procedure. An application of the flow equation derived was made to a simple model of steady evaporation from a bare soil containing a shallow water table. A significant result of the calculation was that the standard flow theory, applicable only to non-swelling porous media, will always under- estimate the rate of evaporation when it is applied to a swelling porous medium. Identifiers: Correlation.

Experiments carried out on an Avondale loam soil indicated that the thermal inertia concept of soil water content detection was reasonably sound. The volumetric water contents of surface soil layers between 2 and 4 cm thick were found to be linear functions of the amplitude of the diurnal surface soil temperature wave for clear day-night periods. They were also found to be linear functions of the daily maximum value of the surface

LIBRARY U. OF I. URBANA

soil-air temperature differential. Tests on three additional soils ranging from sandy loam to clay indicated that the relations determined for Avondale loam could not be accurately applied to these other soil types. When the moisture characteristic curves of each soil were used to transform water contents into pressure potentials, however, it was found that soil water pressure potential could be determined without prior knowledge of soil type, and thus its value as a potential soil water status survey tool was significantly enhanced. Identifiers: *Lake Chad, *Isotope tracing, *Biorhexistasy, Chemical budget.

As a consequence of intense evaporation and transit through a succession of sedimentary traps (flood plains, lake, dune aquifer, and interdune depression), the isotopic composition and the characteristics of the dissolved and suspended loads of Lake Chad water change downstream in a regular manner resembling chromatography. The migration of the water and chemical constituents from one end to the other of this endorheic basin, extending from the humid tropics to the desert margins, was outlined and quantified. The erosion, transport, and sedimentation phenomena and the natural saline and isotope tracing methods were studied simultaneously. It was illustrated that these two avenues of research are complementary, justifying the use of common models, and the indispensable to each other. (Prickett-ISWS)

INTERDISCIPLINARY MODELING OF LIMNOLOGICAL ASPECTS OF THE GREAT LAKES,
Great Lakes Basin Commission, Ann Arbor, Mich.
L. T. Crook.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 105-160, 1975. 7 fig, 7 tab, 1 append.

Descriptors: *Great Lakes, *Limnology, *Model studies, *Planning, *Feasibility studies, *Evaluation, *Water resources development, Programs, Data acquisition, Water management(Applied), Methodology, Comprehensive planning, Rivers, Simulation analysis, Systems analysis.
Identifiers: *Interdisciplinary analysis.

The Great Lakes Basin Commission's feasibility study of the mathematical modeling capabilities of the current state-of-the-art for planning in the Great Lakes is discussed. The Commission decided to restrict its systems analysis effort to the limnological aspects of the Great Lakes and exogenously introduce the socio-economic factors and levels of resource-per-capita-use factors. This paper describes the limnological systems, identifies the methodological approach, reports on the water resource problems, variables and data requirements, evaluates the state-of-the-art of available models and their interrelationships and adaptability to planning problems within the Great Lakes, discusses model synthesis for planning needs, and gives conclusions and recommendations of Phase I of the study and the objectives and management structure proposed for Phase II. The levels of modeling feasibility of a series of planning categories are analyzed for quantitative evaluation on the basis of the availability of data, quality of models, and requirements for planning. The objective of the proposed main limnological systems and analysis program, appended for reference, is to develop models of the physical, chemical and biological processes in the Great Lakes in sufficient detail to enable planners, engineers and economists to assess the consequences of alternative planning and resource development strategies. DISCUSSION (OF, 'INTERDISCIPLINARY MODELING OF LIMNOLOGICAL ASPECTS O THE GREAT LAKES' BY L. T. CROOK),
State Univ. of New York at Albany. Dept. o Biological Sciences.
D. C. McNaught.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems University of Colorado, Boulder, June 19-22 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17 3.72-4, New York, NY, p 161-170, 1975. 2 equ.

Descriptors: *Great Lakes, *Limnology *Planning, *Model studies, *Water quality *Eutrophication, Ecosystems, Management Equations, Zooplankton, Phytoplankton, Lake Ontario, Biomass, Resource allocation, Aquatic environment, Simulation analysis, Systems analysis.
Identifiers: Great Lakes River Basin Commission Prediction, Lake George(N.Y.).

Models of limnological systems must have predictive capabilities to be useful for planning or for developing new ecological concepts. Models of the major biotic components of the ecosystem, such as those described by L. T. Crook, can be validated. Furthermore, their application in planning is readily demonstratable: some of these models are easily perturbed, making it possible to predict changes in the numerical abundance of various types of organisms with increased eutrophication. Specifically addressed herein are the ranking problems of the Great Lakes: (1) eutrophication; and (2) water quality. These problems can be examined in the context of the biotic characteristics of these great aquatic systems or from the viewpoint of their management. Considered are the origin and validation of a zooplankton model, observations on Lake Ontario, a resource allocation model for zooplankton which predicts composition, and validation and perturbation analysis of the resource model. In conclusion, simple process models describing primary and secondary production in the Great Lakes can be coupled to provide realistic estimates of production following perturbation of these aquatic ecosystems. The author generally supports Phase II of the Limnological Systems Analysis discussed by Crook. (See also W76-00060) (Bell-Cornell)

Mathematical simulation of physical, chemical and biological processes of lakes exemplifies the interdisciplinary character of systems analysis. To develop a model capable of serving the broad objectives of planning for the management of, say, the Great Lakes, demands close interaction of many disciplines, including hydrology, meteorology, limnology, hydrodynamics, water chemistry, aquatic biology and ichthyology, as well as social and political scientists and water planners. As an example of interdisciplinary model building, Orlob considers the problem of designing a planning tool for evaluating the response of a lake's ecosystem. Such a tool, recently developed under auspices of the Department of Interior, serves to illustrate some problems of interdisciplinary communication. Discussed are ecologic concepts, including the ecosystem, primary production, algae-bacteria symbiosis, growth rate limitations, and growth rates of higher trophic levels. Other environmental factors considered are heat energy, toxicity, sedimentation, respiration, and light availability and attenuation. The model formulation, based on mass conservation, is described in terms of abiotic constituents and organic biomass. Finally, the initial model application results are considered. To conclude, a model of ecologic interactions, centered on water quality, can be adapted to a wide variety of aquatic systems, including stratified lakes. (See also W76-00060) (Bell-Cornell)

HYDROLOGY OF THE SALT RIVER AND ITS RESERVOIRS, CENTRAL ARIZONA,
Arizona State Univ., Tempe.
J. N. Rinne.
Journal of the Arizona Academy of Science, Vol 10, No 2, p 75-86, June, 1975. 12 fig, 2 tab, 31 ref.

Descriptors: *Reservoir storage, *Ecology, *Water supply, *Semiarid lands, *Aquatic environment, Arizona, Hydrology, Floods, Drainage, Flood control, Rainfall, Precipitation(Atmospheric), Droughts, River basins, Water storage, Pumped storage, Dams, Lakes, Water shortage, Water allocation(Policy), Hydroelectric plants, Nutrients.
Identifiers: Salt River, Central Arizona.

The Salt River system of reservoirs is situated under hot-desert climatic regime and merits constant and continued monitoring of environmental conditions. Ever-increasing population densities in the metropolitan Phoenix area and requirements for water in a climate and area not characterized by such continually amplify the activities imposed upon these multiple-use impoundments. Hydrology, organic nutrient input and ecology of such desert reservoirs are largely dependent upon periodic flooding, and as a result, these aquatic systems may be ecologically unique. Extended drought periods combined with seasonal patterns of dam operation to supply domestic and irrigation water and hydro- electric power result in extreme changes in reservoir water levels and ecology. Recent structural modifications of dams on the Salt River system of reservoirs resulting in two pumped-storage units and increased generating capacities will further complicate the present hydrological scheme and future study of these aquatic environs. Available from the National Technical Information Service, Springfield, Va 22161, as PB-245 763. Purdue University Water Resources Research Center, Technical Report No 62, June, 1975. 70 p, 30 fig, 37 ref. OWRT A-029-IND (10).

Descriptors: *Thermal Stratification, *Water temperature, *Interferometry, Thermal radiation, Radiation, Heat, Temperature, Thermal properties, Heat budget, Water circulation, Physical properties, Thermal conductivity, Lakes, Rivers, Ponds, Cooling, *Diffusion, Model studies, *Pollutant identification, *Path of pollutants.
Identifiers: Mach-Zehnder interferometer.

Thermal stratification induced by solar radiation and cooling of thermally stratified and unstratified water from the surface was modeled in a laboratory to gain improved understanding of temperature structure in lakes, reservoirs, and ponds. Understanding of internal physical processes in stagnant waters is required in order to develop predictive models for complex hydraulic systems on a steady and unsteady basis. Experimentally, solar radiation was simulated by tungsten filament lamps in parabolic reflectors of known spectral radiation characteristics. The unsteady temperature distribution resulting from radiant heating of pure water in a glass-walled test cell was measured with a Mach-Zehnder interferometer. An analytical model appropriate for the laboratory arrangement was developed to predict the thermal stratification induced by radiation. Comparison between measured and predicted temperature profiles showed good agreement thus verifying the radiative and total energy transport models. Cooling of an initially uniform and thermally stratified layer of water was studied by observing the interference fringe patterns and by measuring interferometrically the temperature distribution. The buoyancy induced flow and temperature structure was quite complex. Detailed observations and discussions of results are given. A model was developed to predict the dynamics of the convective layer, and the predictions were in good agreement with the experimental data.

AIR PRESSURE OVER SURFACES EXPOSED TO WIND--II. RESERVOIRS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
A. R. Dedrick.
Transactions of the American Society of Agricultural Engineers, Vol 18, No 3, p 508-513, May-June 1975. 3 fig, 6 tab, 9 ref.

Descriptors: *Wind pressure, *Reservoirs, Lake breezes, Design criteria, Winds, Laboratory tests, Pressure, Films, Membranes, Slopes.

Reservoirs lined with unprotected flexible membrane and film are subject to damage during high winds. The magnitude and location of wind forces were determined over reservoir models in a wind tunnel. Reservoir geometric characteristics studied included leeward and approach slope, approach-slope height, and breadth-to-depth ratio. The negative pressure area in relationship to the entire reservoir was minimum when the approach and leeward slopes and breadth-to-depth ratio were at the minimums studied, 1:4, 1:4, and 5, respectively. Under these conditions, the adverse pressure area was confined to the leeward slope and a small area near the top edge of the downwind slope, and the entire reservoir bottom was under positive pressure. In contrast, when the slope was steeper, flow separation zones probably were fully developed and covered larger parts of the reservoirs (entire reservoir when the breadth-to-depth ratio was 5), which resulted in nearly constant negative pressures over the interior surfaces of these systems. EVALUATION OF A THERMOCOUPLE HYGROMETER FOR MEASURING LEAF WATER POTENTIAL IN SITU,
Washington State Univ., Pullman. Dept. of Agronomy and Soils.
G. S. Campbell, and M. D. Campbell.
Agronomy Journal, Vol 66, No 1, p 24-27, January-February, 1974. 5 fig, 14 ref.

Descriptors: *Pressure measuring instruments, Pressure, Potatoes, Wheat, Vapor pressure, Leaves, Hygrometry, Evaluation, Measurement, Methodology.
Identifiers: Thermocouple hygrometer, *Leaf water potential, Pressure chamber.

Several methods for measuring leaf water potential in situ with thermocouple psychrometers or hygrometers have recently become available. Disadvantages of these methods include difficulty in construction or use, or excessive modification of the leaf environment. Comparisons between in situ and other measurements are generally lacking. An aluminum hygrometer which is relatively easy to build and use and covers only about 1.5 sq cm of leaf area is described. This hygrometer was tested in the laboratory and the field and readings were compared with those made with a pressure chamber for several plant species. The leaf hygrometer worked well in both field and laboratory situations. Comparisons between readings with the leaf hygrometer and a pressure chamber gave regression lines with slopes of 1, but the average pressure chamber reading was 0.4 to 1 bar lower than that obtained with the leaf hygrometer. The leaf hygrometer appeared to respond to plant water potential changes in less than 30 minutes. The equivalent error due to temperature gradients within the chamber was less than 0.4 bar. Measurement precision with this technique appears to be about 1 bar or better. (Skogerboe-Colorado State)

OXYGEN CONSUMPTION IN THE BROWN TROUT, SALMO TRUTTA M. FARIO L,
Ceskoslovenska Akademie Ved, Brno. Ustav pro Vyzkum Obratlovcu.
M. Penaz, and M. Prokes.
Zool Listy., Vol 22, No 2, p 181-188. 1973.

Descriptors: *Brown trout, *Oxygen, Respiration, Temperature, Metabolism.

O2 consumption by respiration was investigated in brown trout, Salmo trutta m. fario, of various size and age (0+ to 3+) within a water temperature range of 10-20 C. The experiments were conducted under conditions of routine metabolism but were aimed at the needs of transportation of fish. Water temperature as well as individual weight affects the absolute and specific 02 consumption. Trout fry, o.1 g average body weight, consume 0.042 mg 02/h at 10 C, and 0.083 mg 02/h at 20 C. Old individuals weighing 100 g on the average consume 12.87 mg 02/hr at 10 C, and 28.20 mg 02/h at 20 C. Copyright 1974, Biological Abstracts, Inc.

WATER UPTAKE BY COTTON ROOT SYSTEMS: AN EXAMINATION OF ASSUMPTIONS IN THE SINGLE ROOT MODEL,
Agricultural Research Service, Ames, Iowa.
H. M. Taylor, and B. Klepper.
Soil Science, Vol 120, No 1, p 57-67, July 1975. fig, 3 tab, 20 ref.

Descriptors: *Soil-water-plant relationships, *Cotton, *Hydraulic conductivity, *Soil water movement, Consumptive use, Water utilization, Root systems, Groundwater potential, Soil water, Soil physical properties, Agriculture, Agronomy, Mathematical models, Laboratory tests, *Absorption.
Identifiers: *Water uptake(Cotton), Rooting density.

Several mathematical models have been developed to describe water uptake by plant root systems. These models usually incorporate one or more of the assumptions that water is proportional to rooting density, to soil hydraulic conductivity and to the water potential difference between the root surface and that in bulk soil midway between two adjacent roots. An experiment was conducted with cotton at the Auburn rhizotron to test the validity of these three assumptions. Soil water potential, soil hydraulic conductivity, water uptake, and rooting density were measured or estimated as functions of soil depth and time. Average plant water potential for a water extraction period was estimated from pressure chamber and continuous stem-diameter measurements. The assumption that water uptake is proportional to rooting density was valid. However, there appeared to be a large resistance in the pathway from root epidermis to root xylem. The other two assumptions must be modified to include this resistance. Therefore, water uptake was proportional to the water potential difference between root xylem and bulk soil and to the hydraulic conductivity of the combined soil-root pathway. There was no dependence-of-roots effect on the validity of these relationships. (Sims-ISWS)

MORPHOLOGICAL CHARACTERISTICS OF THE CRUCIAN CARP OF THE KAIRAK-KUM RESERVOIR, (IN RUSSIAN),
Akademiya Nauk Tadzhikskoi SSR, Dushanbe. Institut Zoologii i Parazitologii.
E. A. Fedorov.
Izv Akad Nauk Tadzh SSR Otd Biol Nauk., No 1, p 75-78. 1973. (Tadzh. summ.).

Descriptors: *Carp, Detritus, Reservoir, Fish stocking, Fish food organisms, Commercial fish, Fisheries.
Identifiers: *Carassius-Auratus-Gibelio, *Crucian Carps, Detritus, *USSR(Kairak-Kum Reservoir)

The crucian carp (Carassius auratus gibelio) was introduced in the Kairak-Kum Reservoir, USSR in the fall of 1959 to replenish the stock of economically valuable fishes and to utilize the food base, particularly the detritus, more fully. Under the new conditions the carp survived, reproduced and has become a commercial fish. The variations of meristic characters are similar to those of the crucian carp from other bodies of water. The morphological characters under the effect of the new environment changed easily, especially those pertaining to body parts performing important functions (Fins, pecto-ventral length and postorbital head length).--Copyright 1974, Biological Abstracts, Inc.

A STUDY OF THE MEXICAN DUCK (ANAS DIAZI) IN SOUTHEASTERN ARIZONA,
Arizona Game and Fish Dept., Phoenix.
G. P. O'Brien.
Special Report 5, June, 1975. 55 p, 18 fig, 13 tab, 24 ref.

Descriptors: *Aquatic life, *Drainage effects, *Habitat improvement, *Water supply, Maps, Ducks(Wild), *Mexican duck, Habitats, Wildlife habitats, Potholes, Wildlife conservation, *Arizona, Mexico, Drainage, Water holes, Drying, Water sources, Water utilization.
Identifiers: Southeastern Arizona, Habitat loss.

Due to its declining population in this country, the Mexican duck is currently listed as endangered by the U.S. Department of the Interior. The major cause attributed to the decline is loss of habitat, as a result of draining natural wetlands. Surveys made in Mexico in 1966 indicated that Mexican ducks were still present in small numbers, but scattered. Natural sinks and potholes were reported gone or rapidly drying due to livestock overgrazing, drainage for farming or becasue of water diversion for human usage. (Robinett-Arizona)

SOIL DETACHMENT FROM CLODS BY SIMULATED RAIN AND HAIL,
Agricultural Research Service, Manhattan, Kans.
L. J. Hagen, L. Lyles, and J. D. Dickerson.
Transactions of the American Society of Agricultural Engineers, Vol 18, No 3, p 540-543, May-June 1975. 2 fig, 6 tab, 18 ref.

Descriptors: *Hail, *Simulated rainfall, *Soil erosion, Mulching, Soils, Raindrops, Rainfall, Soil conservation, Agriculture, Agroclimatology, Wind velocity, Precipitation(Atmospheric).
Identifiers: *Hail size, *Clods, Terminal velocity, Kinetic energy, Soil detachment, Hail damage.

The effects of hail size and kinetic energy on soil detachment from clods during simulated rain under various windspeeds and amounts of surface mulch was examined. Amount of soil detachment depended on size and energy of hail, windspeed, and surface cover as well as on interactions among these variables. A hail energy of 0.53 cm-newtons per square cm increased soil detachment from clods more than 50%, and an energy of 5.3 cm-newtons per square cm more that doubled soil detachment as compared with no hail. Small hail caused some damage to clods but quickly covered the surface to form a protective cover against subsequent wind, rain, and hail damage. Thus, a hail diameter exceeding about 0.75 cm was necessary to increase soil detachment above the no-hail level. Both seeding clouds to reduce hail size, if successful, and maintaining a 50% or greater mulch cover could reduce soil detachment from clods during hailstorms. (Lee-ISWS)

Volgograd Agricultural Inst. (USSR).
V. G. Nesterov, A. A. Vakulin, and K. S. Kal'yanov.
Dokl Vses Ord Lenina Akad S-Kh Nauk Im V I Lenina, No 7, p 5-6, 1973.

Descriptors: *Forecasting, *Wind erosion, *Soils, *Solar radiation, Tides, Oceans.

The dynamics of development of wind erosion of soils should be regarded as a consequence of the effect of long-period tidal-producing forces, solar activity, and interrelations of the ocean-continent system, which cause changes of atmospheric circulation and of the hydrothermal regime of the earth. The relation between wind erosion of soils and solar activity is considered, and a scheme is presented of the periodicity of development of wind erosion during the past 6000 yr, in which 4 phases of deflation corresponding to epochs of decreased precipitation effectiveness are distinguished. The phases of wind erosion are divided into periods and the periods into cycles. Primary attention in matters of combatting wind erosion should be concentrated on forecasting the phenomena and on the correct use of the fluctuations of hydrothermal regime, since the effectiveness of antideflation measures depends to a considerable extent on this.--Copyright (c) 1974, Biological Abstracts, Inc.

2K. Chemical Processes

THE SOLUBILITY OF FERRIC OXYHYDROXIDES IN NATURAL WATERS,
Kansas State Univ., Manhattan. Dept. of Geology.
D. O. Whittemore, and D. Langmuir.
Ground Water, Vol 13, No 4, p 360-365, July-August 1975. 1 fig, 4 tab, 22 ref.

Descriptors: *Solubility, *Iron compounds, *Water properties, *Iron oxides, *Water chemistry, Physical properties, Chemical properties, Phase diagrams, Saturation, Oxidation-reduction potential, Chemical reactions, Geochemistry, Oxides, Hydrogen ion concentration, Chemical potential, Water.
Identifiers: *Ferric oxyhydroxides, *Natural waters, *Dissolved iron, *Ferric iron, *Ferrous iron, Magnetite, Siderite, Goethite, Hematite.

Iron in groundwater is often present both in solution and as suspended ferric oxyhydroxides. In most instances amounts of dissolved iron in natural waters are limited by the solubility of the ferric oxyhydroxides, whether suspended or present as part of aquifer materials. Oxyhydroxide solubilities, which range widely in natural waters, may be described by pQ = -log (Fe+++) (OH-)(OH-)(OH-), where (Fe+++) (OH-)(OH-)(OH-) is the product of ion activities in the water. pQ values calculated from Fe(II), Eh, and pH measurements in several types of high iron ground and surface waters (Fe(II) = 0.02 to 1460 ppm) indicate that most of the waters are in equilibrium with ferric oxyhydroxides which range from amorphus material to crystalline goethite (pQ values at 25C

LIBRARY U. OF I. URBANA, Library Processing

from about 37 to 44, respectively). Stabilities generally increase (higher pQ's) in a given water with time. In general, the lower the dissolved iron, the more soluble is the oxyhydroxide precipitated and the slower its increase in stability. This was observed both in coastal-plain groundwaters (pQ = 36.6 - 42.7), and in laboratory aged solutions. The faster the oxidation and hydrolysis rate of dissolved Fe(II), the lower the pQ, as shown by the reaction of mineralized spring waters with varying amounts of surface waters (pQ = 37.2 - 41.5). (Henley-ISWS)

Tehran Univ., (Iran). School of Engineering.
S. Nejand, and R. A. Khan.
Ground Water, Vol 13, No 3, p 269-274, May-June 1975. 7 fig, 2 tab, 15 ref.

Descriptors: *Groundwater, *Groundwater basins, Water types, *Water quality, *Diagenesis, Percolating water, Freshwater, Alluvial aquifers, Aquifers, Potentiometric level, Geochemistry, Water properties, Hydrogeology, Chemical reactions, Chemical analysis, Water sources, Anions, Chlorides, Bicarbonates, Sulfates.
Identifiers: *Iran(Shiraz Basin), Triangular plots.

Groundwater of Shiraz alluvial basin in Zagros range (south Iran) showed three principal anion types, namely chloride, sulfate, and bicarbonate. Intermediate types between these groups were also present, which seem to represent modifications in groundwater due to diagenesis. Possible chemical origin of the groundwater is mainly due to two major processes either acting individually or collectively, i.e., solution of minerals of the geological formation and mixing of groundwater accompanied by the precipitation of some constituents such as calcium. GROUND WATER GEOCHEMISTRY OF THE PAHASAPA LIMESTONE,
South Dakota School of Mines and Technology, Rapid City. Dept. of Geology and Geological Engineering.
P. H. Rahn.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-246 103, $3.75 in paper copy, $2.25 in microfiche. Completion Report, July 1975. 29 p, 9 fig, 4 tab, 15 ref. OWRT A-046-SDAK (1). 14-31-0001-4042.

Descriptors: *Geochemistry, Radioisotopes, *Radioactive dating, Age, Groundwater, Water quality, *South Dakota, *Wyoming, *Water wells, *Springs, Dissolved solids, Carbon dioxide, Calcite, *Groundwater movement, Pollutant identification.
Identifiers: Pahasapa Limestone(SD-WYO), Black Hills(SD-WYO).

Springs and wells penetrating the Pahasapa (Madison) LIMESTONE AND Minnelusa Formation near the Black Hills, South Dakota and Wyoming, were analyzed for chemical constituents. The total dissolved solids (TDS) ranged from a high of 2,280 ppm at Cascade Spring to a low of 150 ppm at springs along Ditch Creek. Discharge rates and TDS data indicate that the combined chemical weathering for the Paliozoic aquifer results in a reduction of the landscape of at least 0.55 inches per 1,000 years. Radiocarbon isotope age dating of selected well waters penetrating the Pahasapa Limestone in adjoining basins shows that there is a slow deep ground water movement out away from the Black Hills. The oldest water encountered was at the Midland, South Dakota well where 22,800 year old wa was found. The deposition of calcareous t below some springs seems to be due to the loss pressure on deeply circulation waters, and summer warming of the spring waters. Both pressure loss and temperature rise leads to lowering in the solubility of carbon dioxi which, when released, causes calcite precipitate. (Wiersma-South Dakota State)

BAYOCEAN SPIT, OREGON: HISTORY DEVELOPMENT AND EROSIONAL DESTRU TION,
Western Washington State Coll., Bellingha Dept. of Geography.
T. A. Terich, and P. D. Komar.
Shore and Beach, Vol 42, No 2, p 3-10, Octo 1974. 10 fig, 4 ref. NOAA 04-5-158-2.

Descriptors: *Beach erosion, *Waves(Wat *Erosion, *Jetties, *Tides, *Storms, *Oregon, toral drift, Shores, Oceans, Dikes, Sand bars.
Identifiers: *Bayocean Spit(Ore).

The history of Bayocean Spit in Oregon traced starting from its early development int thriving tourist, vacation, and retirement com nity to its ultimate destruction by waves, tid erosion and some mismanagement. The histor overview dated back to 1907 and traced up to 19 The affects of railroad and ordinary road devel ment, the 1929 depression, and world war II w depicted and analyzed in detail. It was pointed that the construction and lengthening of a je near the north end of the spit accelerated the e sion of the spit in its narrow neck, and a comb tion of high tides and storm waves ultima broke the neck. Subsequent tides deepened widened the breach. When a jetty is construc the longshore current deposits sands in and aro the jetty and must erode at some other place pick up the sand which the longshore curren capable of transporting. Erosion will take pl after the construction of a jetty even in ar where there is no nets and drift. Sand will ten accumulate close to the jetty with erosion greater distances from the jetty which was principal cause of the erosion of the neck Bayocean Spit. (Bhowmik-ISWS)

Journal of Geophysical Research, Vol 80, No 2 3032-3043, July 20, 1975. 3 fig, 4 tab, 31 ref, pend. ONR N-00014-68-A-0308-0002.

Descriptors: *Sediments, *Mixing, *Ocea Benthos, Benthic fauna, Model studies, Mat matical models, Sampling, Bottom sampl Cores, Oceanography.
Identifiers: *Abyssal sediments, Biological m ing.

Biological mixing in deep-sea sediments described in terms of a time-dependent eddy di sion model, with mixing taking place at depth constant eddy diffusivity D. The differential eq tion describing the model was solved for an pulse source of tracer delivered to the plan surf at the top of the mixed layer. The solution served as a Green's function, and was usec determine the distribution of tracer in depth time for a surface input of tracer. The cha teristic properties of the solution are dependen the dimensionless parameter D/Lv, where v is sedimentation rate. If D/Lv is greater than 10, surface layer becomes homogeneous. If D/L

less than 0.1, mixing can take place before the sediments are buried, and the surface concentration propagates downward into the sediments with little dispersion. For all values of D/Lv, the weighted mean depth of the concentration distribution is the depth at which an impulse source would be found in the sediment if no mixing had taken place. Microtektite data indicate that abyssal sediments are mixed from the surface to a maximum mixing depth between 17 and 340 cm below the surface. Mixing occurs at rates between 1 and 100 sq cm/1000 years. Higher mixing rates may occur nearer the surface, but microtektite distributions cannot be used to estimate these rates in the presence of the deeper, slower mixing. Estimates for D based on dimensional analysis of sediment reworking rates for nearshore organisms were used to predict abyssal mixing rates by invoking the assumption that mixing is proportional to biomass. Identifiers: Ocean floor.

A model for interstitial silica concentrations was derived, incorporating biological mixing of sediments. This model predicted concentrations and gradients and could account for the observed geographical variations in interstitial silica on the basis of a dynamic balance between solution of silica particles and diffusion from the sediments. The flux of particulate biogenous silica into the sediments was confirmed as an important parameter controlling interstitial silica concentrations. Biological mixing of sea floor sediments also has an important influence on interstitial composition by modifying the depth at which dissolving particles react. Faster mixing raises the interstitial concentration. The rate at which siliceous particles dissolve also plays a role; the slower they dissolve, the greater the interstitial silica concentration. Measurements on near-bottom water of the Atlantic showed no consistent gradients in dissolved silica, but Antarctic bottom water seemed significantly more variable in the benthic boundary layer than in the water mass above or in the benthic zone of North Atlantic deep water. 3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

THE H. K. FERGUSON COMPANY CONCEPTUAL DESIGN OF A 50 MGD DESALINATION PLANT.
Ferguson (H.K.) Co., Cleveland, Ohio.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-245 875, $7.00 in paper copy, $2.25 in microfiche. Special Report No 08, August 1965, 193 p, 3 fig, 6 tab, 11 ref. OSW 14-01-0001-517.

Descriptors: *Deslination, Distillation, *Flash distillation, Sea water, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics, Evaluation, Costs, *Design criteria.
Identifiers: *Process design, *Multiple-effect multiple-flash system.

The objective of this study is to produce a design which advances the technology of seawater conversion and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be designed for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical California coastal site with capital and operating costs based on December, 1964, values. The process described in this study employs a multiple-effect, multi-flash system consisting of twenty-one effects of flash evaporation, five stages per effect. To provide a high degree of reliability the plant has been designed as two identical parallel trains of 25 MGD each, thus, a failure of any major component will result in a minimum loss of plant capacity until the failed equipment can be reparied or replaced. Performance ratio is 20.4 lbs. water/lb. steam with a total water cost of $0.47 per thousand gallons. (See also W76-00159 thru W76-00173) (OWRT)
W76-00158

THE FLUOR CORPORATION LTD. CONCEPTUAL DESIGN OF A 50 MGD DESALINATION PLANT.

Descriptors: *Desalination, Distillation, *Flash distillation, Sea water, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics, Evaluation, Costs, *Design critera.
Identifiers: *Process design.

The objective of this study is to produce a design which advances the technology of seawater conversion and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be designed for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical California coastal site with capital and operating costs based on December, 1964, values. The plant described employs the conventional multistage flash process. Four parallel evaporator trains were selected to best satisfy conditions of the study. Trains are arranged symmetrically with heat rejection sections centralized about

LIBRARY U. OF I. URBANA, Library Bldg.

a common pump pit to minimize costly piping runs between the various elements. All evaporator vessels are of concrete construction prestressed by post tensioning both longitudinally and circumferentially. Tubes of 90-10 CuNi, performance ratio is 13.6 lbs. water/lb. steam, water cost is $0.421 per thousand gallons. (See also W76-00158 thru W76-00173) (OWRT)
W76-00159

THE BADGER COMPANY CONCEPTUAL DESIGN OF A 50 MGD DESALINATION PLANT.
Badger Co., Inc., Cambridge, Mass.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-245 877, $7.50 in paper copy, $2.25 in microfiche. Special Report No 10, August 1964, 202 p, 9 fig, 19 tab, 8 ref. OSW 14-01-0001-515.

Descriptors: *Desalination, Distillation, *Flash distillation, Sea water, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics, Evaluation, Costs, *Design criteria.
Identifiers: *Process design.

The objective of this study is to produce a design which advances the technology of seawater conversion and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be designed for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical California coastal site with capital and operating costs based on December, 1964, values. The Badger study considers the Multi-Stage Flash (MSF) process, achieving a minimum overall pressure drop by an uninterrupted flow path of brine and product water through the evaporator flashing area. A performance ratio of 20 pounds of product water per pound of steam yields a calculated water cost of $0.323 per thousand gallons. The specified 30-year write-off at low interest rates allows comparatively high capital expenditures favoring titanium tubing for brine service which contributes to low maintenance and operating costs. (See also W76-00158 thru W76-00173) (OWRT)

THE DOW CHEMICAL COMPANY CONCEPTUAL DESIGN OF A 50 MGD DESALINATION PLANT.
Dow Chemical Co., Midland, Mich.
Available from the National Technical Information Service, Springfield, Va 22161, as PB 245-886, $11.25 in paper copy, $2.25 in microfiche. Special Report No 11, 1965, 336 p, 37 fig. OSW 14-01-0001-519.

Descriptors: *Desalination, Distillation, *Flash distillation, Sea water, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics Evaluation, Costs, *Design criteria.
Identifiers: *Process design, *Multiple-effect falling-film process.

The objective of this study is to produce a design which advances the technology of seawater conversion and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be designed for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical California coastal site with capital and operating costs based on December, 1964, values. The system selected by Dow for this study is based on the multiple-effect, falling-film process. Twenty effects are used yielding a gain ratio of 14.9 and a water cost of $0.427 per thousand gallons. Seawater pretreatment yields a feed with no alkalinity, no oxygen, no dissolved gases. An ion exchange pretreatment allows the feedwaters to be heated to more than 325degree F.Included as a part of this study is a computer program for a Multiple Effect LTV Evaporation process by Houston Research Institute. (See also W76-00158 thru W76-00173.) (OWRT)

C. F. BRAUN AND COMPANY CONCEPTUAL DESIGN OF A 50 MGD DESALINATION PLANT.
Braun (C. F.) and Co., Alhambra, Calif.
Available from the National Technical Information Service, Springfield, Va 22161, as PB 245-878, $7.25 in paper copy, $2.25 in microfichecopy. Special Report No 13, August 1965, 198 p. 30 fig, 2 tab, 28 ref. OSW 14-01-0001-527.

Descriptors: *Desalination, Distillation, *Flash distillation, Sea water, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics, Evaluation, Costs, *Design criteria, *Long-tube vertical distillation.
Identifiers: Process design.

The objective of this study is to produce a design which advances the technology of seawater conversion and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be designed for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical Californi coastal site with capital and operating costs based on December, 1964, values. The most efficient scheme is claimed to be a combination of the long tube vertical (LTV) multiple effect evaporation and the multistage flash concept. The major portion of the process heat load is transferred at constant temperature differential in the falling film evaporator, the most thermally efficient part of the process. Thermodynamic improvement over the conventional LTV process is realized by utilizing MSF stages for heating the seawater. A unique design for the multiple effect evaporator stages consists of a series of annular contiguous effects with common walls. Cost of product water is $0.313 per thousand gallons. (See also W76-00158 thru W76-00173.) (OWRT)

W76-00165

LOCKHEED MISSILES AND SPACE COMP[illegible] CONCEPTUAL DESIGN OF A 50 M[illegible] DESALINATION PLANT.
Lockheed Missiles and Space Co., Sunn[illegible] Calif.
Available from the National Technical Info[illegible] tion Service, Springfield, Va 22161, as PB-245[illegible] $8.50 in paper copy, $2.25 in microfiche.Sp[illegible] Report No 16, 1965, 262 p, 32 fig, 22 tab, 52[illegible] OSW 14-01-0001-539.

Descriptors: *Desalination, Distillation, *[illegible] distillation, Sea water, *Heat transfer, Desig[illegible] strumentation, *Evaporation, *Condensa[illegible] Economics, Evaluation, Costs, *Design cri[illegible] Condensers.
Identifiers: *Process Design, Condenser tube [illegible] dle design.

The objective of this study is to produce a d[illegible] which advances the technology of seawater

version and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be designed for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical California coastal site with capital and operating costs based on December, 1964, values. This study embodies a multi-flash system incorporating advanced design concepts. Plant is divided into four equal evaporator modules(12.5 MGD each) each consisting of 3 heat rejection and 27 heat recovery stages. Each module, a complete plant in itself, can be operated and controlled independently allowing planned outstages for maintenance without shutting down the complete system. Innovations include a condenser tube bundle design which eliminates water boxes and expansion bellows and the use of a dropwise promoter to achieve a practically attainable dropwise condensation system. Water cost is $0.43 per thousand gallons. (See also W76-00158 thru W76-00173) (OWRT)
W76-00166

BALDWIN-LIMA-HAMILTON CORP. CONDEPTUAL DESIGN OF A 50 MGD DESALINATION PLANT.
Baldwin-Lima-Hamilton Corp., Philadelphia, Oa.
Available from National Technical Information Service, Springfield, Va 22161, as PB-245 880, $5.25 in paper copy, $2.25 microfiche. Special Report No 17, April 1966, 36 p, 15 fig, 19 tab, 33 ref. OSW 14-01-0001-513.

Descriptors: *Desalination, Distillation, *Flash distillation, Sea water, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics, Evaluation, Costs, *Design criteria.
Identifiers: *Process Design, *Combined multiple extraction system.

The objective of this study is to produce a design which advances the technology of seawater conversion and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be designed for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical California coastal site with capital and operating costs based on December, 1964, values. The BLH design is based on the concept of a combined Multiple Extraction (COMEX) system, yielding a performance ratio of 18 and consisting of a multi-effect, multi-stage (MEMS) process having a top temperature of 255F combined with a once-through system having a top temperature of 290F. Cost of product water is $0.368per thousand gallons. (See also W76-00158 thru W76-00173) (OWRT)
W76-00167

AQUA-CHEM, INCORPORATED CONCEPTUAL DESIGN OF A 50 MGD DESALINATION PLANT.
Aqua-Chem, Inc., Waukesha, Wis.
Available from National Technical Information Service, Springfield, Va 22161, as PB-245 881, $5.75 in paper copy, $2.25 in microfiche. Special Report No 18, December 1965, 120 p, 12 fig. OSW 14-01-0001-514.

Descriptors: *Desalination, Distillation, *Flash distillation, Sea wate, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics, Evaluation, Costs, *Design criteria, Brines.
Identifiers: *Process design, *Single-effect multiple-stage cycle.

The objective of this study is to produce a design which advances the technology of seawater conversion and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be designed for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical California coastal site with capital and operating costs based on December, 1964, values. Aqua Chem views the optimum plant as featuring a brine temperature of 245 F using the simple and extensively field proven single-effect, multi-stage flash cycle employing brine recirculation. The lower cost of vessels attributable to low operating pressures plus the use of titanium tubing indicate an optimized longer life and lower operating cost. Concrete is considered as an alternate construction material provided certain precautions are observed. Total product water cost is $0.291 per thousand gallons. (See also W76-00158 thru W76-00173) (OWRT)
W76-00168

FOSTER WHEELER CORPORATION CONCEPTUAL DESIGN OF A 50 MGD DESALINATION PLANT.
Foster Wheeler Corp., Livingston, N. J.
Available from National Technical Information Service, Springfield, Va 22161, as PB-245 882, $5.75 in paper copy, $2.25 in microfiche. Special Report No 19, September 1965, 118 p, 12 fig. OSW 14-01-0001-518.

Descriptors: *Desalination, Distillation, *Flash distillation, Sea water, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics, Evaluation, Costs, *Design criteria.
Identifiers: *Process design, Heat rejection, Heat recovery.

The objective of this study is to produce a design which advances the technology of seawater conversion and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be desinged for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical California coastal site with capital and operating costs based on December, 1964, values. The plant described is of the conventional single effect, multiple stage type employing four stages of heat rejection and 68 stages of heat recovery. Plant is modular in concept, permitting shop fabrication of 100 foot long modules containing factory tubed condenser bundles and employing internal water boxes for field welding of successive 100 foot sections. An iron modified 70-30 CuNi alloy has been selected as an optimum material for 30 year life. Total cost of product water is calculated at $0.35 per thousand gallons based on a performance ratio of 15. (See also W76-00158 thru W76-00173) (OWRT)
W76-00169

WORTHINGTON CORPORATION CONCEPTUAL DESIGN OF A 50 MGD DESALINATION PLANT.
Worthington Corp., Harrison, N.J.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-245 884, $9.50 in paper copy, $2.25 in microfiche. Special Report No 20, August 1965, 304 p, 34 fig, 37 ref. OSW 14-01-0001-529.

Descriptors: *Desalination, Distillation, *Flash distillation, Sea water, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics, Evaluation, Costs, *Design criteria.
Identifiers: *Process design, Heat rejection, Heat recovery.

The objective of this study is to produce a design which advances the technology of seawater conversion and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be designed for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical California coastal site with capital and operating costs based on December, 1964, values. The Worthington study covers the optimization of a multi-stage flash process designed with four parallel flow streams each employing 59 heat recovery stages and 2 heat rejection stages with a maximum brine temperature of 270F and a gain ratio of 19.76 pounds of water per pound of steam. Total water cost is $0.361 per thousand gallons. Vessels are of steel (ASTM A-285), tubes in the heat rejection section are 9-10 Cuni while those in the heat recovery sections are of aluminum brass. Tube sheets are 90-10 Cuni throughout. (See also W76-00158 thru W76-00173) (OWRT)
W76-00170

THE ALLIS-CHALMERS MANUFACTURING COMPANY CONCEPTUAL DESIGN OF A 50 MGD DESALINATION PLANT.
Allis-Chalmers Mfg. Co., Milwaukee, Wis., Greendale Labs.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-245 883, $6.25 in paper copy, $2.25 in microfiche. Special Report No 21, July 1965, 138 p, 59 fig, 25 ref. OSW 14-01-0001-525.

Descriptors: *Desalination, Distillation, *Flash distillation, Sea water, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics, Evaluation, Costs, *Design criteria.
Identifiers: *Process design, *Cross flow evaporation.

The objective of this study is to produce a design which advances the technology of seawater conversion and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be designed for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical California coastal site with capital and operating costs based on December, 1964, values. This study considers the single-effect multi-cross flow evaporation process (SEMS) to be most promising. The process has already been proven in a demonstration size plant and presently appears to be the simplest and least expensive when considered in conjunction with dual-purpose operation. The plant also lends itself to modular type construction which is considered a cost advantage. Aluminum brass and 90-10 CuNi have been chosen as tubing materials for the heat recovery and heat rejection stages respectively. Predicted water costs are $0.354 per thousand gallons. (See also W76-00158 thru W76-00173) (OWRT)
W76-00171

APPLIED RESEARCH AND ENGINEERING, LTD. CONCEPTUAL DESIGN OF A 50 MGD DESALINATION PLANT.
Applied Research and Engineering Ltd., Durham (England).

LIBRARY U. OF I. URBANA

Report No 22, 1965, 131 p, 34 fig. OSW 14-01-0001-528.

Descriptors: *Desalination, Distillation, *Flash distillation, Sea water, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics, Evaluation, Costs, *Design criteria, Recirculated water.
Identifiers: *Process design.

The objective of this study is to produce a design which advances the technology of seawater conversion and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be designed for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical California coastal site with capital and operating costs based on December, 1964, values. This study favors recirculation in preference to a once-through process. Parameters chosen indicate optimum design to be 69 stages in the heat recovery section and 4 in the heat rejection section. The design considers individual aspects of plant components including tube bundle size and geometry, acid dosing and degassing. Recommended further areas of study would increase heat transfer coefficients via better venting techniques, thin walled tubing, and longer tubes. Possible use of concrete as main vessel structure is suggested. Also use of standby service pumps for all circuits to reduce outage time is suggested. (See also W76-00158 thru W76-00173) (OWRT)
W76-00172

C. F. BRAUN AND COMPANY CONCEPTUAL DESIGN 150-MGD LTV DESALTING PLANT.
Braun (C.F.) and Co., Alhambra, Calif.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-245 889, $6.25 in paper copy, $2.25 in microfiche. Special Report No 23, August 1966, 97 p, 12 fig, 12 ref. OSW 14-01-0001-733.

Descriptors: *Desalination, Distillation, *Flash distillation, Sea water, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics, Evaluation, Costs, *Design criteria, *Long-tube vertical distillation.
Identifiers: *Process design.

A direct comparison is made of the MSF desalting plant designed by Bechtel and the LTV-MSF plant designed by Braun for the Metropolitan Water Department of Los Angeles. The desalting plant is assumed to be located adjacent to the nuclear power plant which supplies steam and power for operation. Identical process parameters were used for both plants; the assumption of identical steam consumption eliminated power plant economics from the comparison. Lower product water costs are claimed for the LTV-MSF process in the areas of both capital cost and operating cost. A claimed thermo-dynamic advantage for the LTV-MSF results in lower total installed heat transfer surface; on the operating side the once-through LTV-MSF process, pumping less sea water by virtue of brine concentration 50% greater than MSF, allows smaller seawater pumps (hence lower pumping cost) and lower acid consumption. (See also W76-00158 thru W76-00173) (OWRT)
W76-00173

MEMBRANE PROCESSES FOR WATER TREATMENT, CONCLUSION,
Aberdeen Univ., (Scotland). Dept. of Chemistry.
J. B. Craig, C. R. Gardner, and P. Meares.
Effluent and Water Treatment Journal, Vol 15, No 7, p 345, 353-356, July, 1975. 2 fig, 45 ref.

Descriptors: *Water treatment, *Desalination, *Membrane processes, *Reverse osmosis, Desalination processes, Separation techniques, Membranes, Semipermeable membranes, *Waste water treatment.
Identifiers: *Piezodialysis, Charge-mosaic membranes.

The four basic designs of reverse osmosis modules are the plate-and-frame, tubular, spiral-wound, and hollow-fiber types. The main applications of reverse osmosis are in the field of desalination and in the treatment of waste and rinse waters. RO will remove non-ionic and organic as well as ionic pollutants. RO is also used as a concentrating and fractionating technique in the food and pharmaceutical industries. It is an attractive alternative to other separation and concentration processes because of its simplicity, versatility, broad applicability, and low energy requirements. The costs per unit produced generally decrease as the size of the plant increases. Overall operating costs are largely affected by the cost and frequency of membrane replacement. A recently introduced membrane process is piezodialysis. Differences between this process and RO are that this process uses charge-mosaic membranes and that the permeate under pressure is a liquid stream far more concentrated than the feed which becomes less concentrated and forms the product in a desalination process. A charge-mosaic membrane contains a parallel alternating array of cation and anion-exchanging resins each of which extends throughout the active thickness of the membrane. Piezodialysis offers the following advantages: small defects in the membrane may cause only a slight decrease in the efficiency of the process and not serious contamination of the product water as would occur in reverse osmosis; uncharged contaminants are likely to remain in the product water from piezodialysis; and, the concentration of salt in the product water can be varied by changing the length of the desalination chamber. (Orr-FIRL)
W76-00241

EVALUATION OF A 35-GPH PORTABLE DESALINATION PLANT AND CONCEPTUAL DESIGN OF A 220-GPH CONTAINERIZED PLANT,
Civil Engineering Lab. (Navy), Port Hueneme, Calif.
J. C. King.
Available from the National Technical Information Service, Springfield, Va 22161, as AD A-004 928, $3.25 in paper copy, $2.25 in microfiche. Naval Facilities Engineering Command, Alexandria, Va, Report No TN-1370, January, 1975. 22 p, 8 fig, 2 append.

Descriptors: *Desalination apparatus, *Desalination plants, *Waste water treatment, *Potable water, Water supply, Sea water, Fresh water.
Identifiers: Mobile water desalination plant.

The performance of a mobile water desalination plant to be used for Navy bases was tested. The Model D-20 Watermaker plant is suitable for temporary use as a portable, self-contained unit to supply water immediately after field forces establish a beachhead. The plant was operated for over 2000 hours. The unit has a low product-to-fuel ratio (10-to-1) and operates with an oil-fired boiler as its heat source. Raw seawater is distilled in a vacuum of about 25 inches mercury, which lowers the boiling point of water to between 115F and 130F, operating temperatures low enough to minimize scale formation. Raw water is distributed through four circuits to: provide a source of raw water for evaporation into distilled vapor; cool the upper heat exchanger which condenses the distilled vapor to fresh water; give power to the jet pump which creates a vacuum in the distillation chamber; and, provide power for the jet pump to discharge brine from the distillation chamber. A conceptual design has been prepared for a 220-gph plant that can be fully self-contained in a standard 8 X 8 X 20 foot container. (Kramer-FIRL)

WATER FOR WYOMING'S COAL,
Geological Survey, Denver, Colo.
H. H. Hudson.

Descriptors: *Water supply, *Water utilizati *Imported water, *Coal mines, *Wyoming, S mines, Mining, Planning, Water requireme Costs, Pipelines, Energy, Coals.
Identifiers: Northeast Wyoming.

In terms of coal, northeastern Wyoming is roug 20,000 square miles extending into six coun stretching from the Big Horn Mountains on west to the Black Hills on the east and nearly far south as Casper. The bulk of the region's m strippable coal deposits are contained wi Campbell County. In fact, Campbell Count reputed to have more coal than any other count the United States. The proposals to import w into northeaster Wyoming involve diversions f the Yellowstone River system. One propo system would transport water from Boysen Re voir on the Big Horn River to Gillette via a mile-long pipeline. The system would del 135,000 acre-feet per year at an estimated $250 acre-foot. This and the following dollar estim are based on 1974 costs. Further downstream the Yellowstone River proper, a diversion is u consideration that would require a 180- pipeline from Hardin, Mont., to Gillette. delivery price per acre-foot at Gillette would about $220, and the system would provide 312 acre-feet annually to northeastern Wyoming. E further downstream on the Yellowstone is ano possible diversion site at Miles City, Mont. A mile aqueduct would be required to deliver w to the Gillette vicinity. The acre-foot cost of w near Gillette would be about $220 for 382,000 a feet per year. (Woodard-USGS)

MANAGEMENT OF UNDERGROUND WATER RESOURCES,
University Coll., London (England).
G. P. Jones.
Quarterly Journal of Engineering Geology, Vol 4, No 4, p 317-328, 1972, 3 fig, 3 tab, 4 ref.

Descriptors: *Management, *Aquifer management, *Groundwater, *Water supply, *Groundwater mining, Demand, Economics, Safe yield, Water supply development, Irrigation, Hydrology, Optimum development.
Identifiers: Libya, United States, Israel.

The choice of water management practice depends partly on normal commercial exploitation and partly on its position as a life-essential. The underground 'resource' that is to be managed includes potable and non-potable waters whether they be in 'temporary' or 'permanent' storage, and consideration needs to be given to the use of non-potable aquifers for waste disposal purposes. Acceptance of management as the promotion of optimum regional welfare requires its introduction in the development of a water resources system at as early a stage as possible. The management scheme should give consideration to a wide range of user requirements and meet such demands from a number of devices at its disposal. Optimum performance will be obtained from widespread modification of the hydrological cycle by the integrated use of surface and subsurface resources. This requires a thorough understanding of all aspects of the cycle, and the degree of mutual interdependence of the components is illustrated. Examples of a variety of management schemes are briefly described and serve to show significant role played by hydrogeology in the design of these schemes. Water-resources management is dependent on specialist hydrological advice, but the status and career opportunities for scientists in this field have yet to achieve parity with those of engineers, and until such time as this is achieved then interdisciplinary study will remain desirable but not realizable. PINES ON A HIGH SALT DIET,
Soil Conservation Service, Cape May, N. J. Plant. Materials Center.
C. R. Belcher, and F. B. Gaffney.
Soil Conservation, Vol 40, No 2, p 11, September 1974.

Descriptors: Salinity, Salt, Saline water, Saline soil, *Pine trees, Seedlings, *New Jersey, *Salt tolerance.
Identifiers: *Japanese black pine.

Soil Conservation Service plant specialists in New Jersey are applying generous amounts of rock salt around pine seedlings. The purpose is to find pines resistant to salt water and salt spray along the seacoast. After testing white pine, Austrian pine, pitch pine and Japanese black pine, the latter was found to be most salt tolerant of the species. (Skogerboe-Colorado State)

GROWTH RESPONSE OF CROPS TO DEPTH AND SALINITY OF GROUND WATER, AND SOIL SUBMERGENCE. I. WHEAT (TRITICUM AESTIVUM L.),
Punjab Agricultural Univ., Ludhiana (India). Dept. of Soils.
T. N. Chaudhary, V. K. Bhatnagar, and S. S. Prihar.
Agronomy Journal, Vol 66, No 1, p 32-35, January-February, 1974. 3 fig, 4 tab, 10 ref.

Descriptors: *Salinity, *Saline soils, Saline water, *Crop response, Crop production, Groundwater, Lysimeters, *Wheat, Growth rates, *Salt tolerance.

Information on crop response to depth and salinity of groundwater and soil submergence is important for planning drainage and optimizing crop production. Response of a semidwarf wheat to four depths (60, 90, 120, and 150 cm) and three salinities (EC 0.5, 2.9, and 5.2 mmho/cm) of groundwater was studied in lysimeters filled with silt loam soil during 1970-71 and 1971-72. The plants were irrigated with water of EC 0.5 mmho/cm when the lysimeters with a 150-cm water table depth indicated a tension of 0.5 bar at a 75-cm depth. Groundwater of EC 0.5 mmho/cm at 60 and 90-cm depths gave highest yields. Comparable increase in the salinity of groundwater caused greater reduction in yield with shallow water tables than with deep water tables. Critical depth of groundwater, for optimum crop production, would vary in relation to its salinity. (Skogerboe-Colorado State)

CORPS URBAN PLANNING IN ST. LOUIS-MALINE CREEK: AN INTERDISCIPLINARY EFFORT,
Army Engineer District, St. Louis, Mo.
E. D. Rahubka, R. F. Astrack, S. V. Bailey, W. G. Dooley, and J. J. Zerega.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 281-308, 1975.

Descriptors: *Water resources development, *Planning, Decision making, Land resources, Drainage, Basins, Hydrology, Economics, Environment, Recreation, Design, Costs, Social aspects, Effects, Alternative planning, Mathematical models, *Missouri.
Identifiers: *Interdisciplinary analysis, *Maline Creek(Mo), St. Louis(Mo), Plan formulation, Urban planning, Modeling, Public participation, Improvement, Choice approach, Technical problems.

Reported is an interdisciplinary study to investigate the varied water and related land resource problems in the St. Louis-Maline Creek. The urban planning effort resulted from work done for the U.S. Army, Corps of Engineers, St. Louis District Office. The approach adopted utilizes the strength of technical experts to direct local decision making toward technically feasible alternative solutions. In this manner, local energies are concentrated and directed to meaningful efforts that are geared to creating needed improvements in a manner which is endorsed and supported by the citizenry affected. Considered are the technical aspects of the study, including plan improvement and objectives, hydrological-economic modeling of the Maline Creek basin to obtain frequency-damage data, the economic and environmental-recreational elements, and design-cost estimates. Considered also are potential synergistic social effects. The paper concludes with a discussion of institutional arrangements and public participation. The approach presented is a step in the direction of restricting technical expertise to technical problems and opening the basic decision making process to greater local influence. DISCUSSION (OF, 'CORPS URBAN PLANNING IN ST. LOUIS-MALINE CREEK: AN INTERDISCIPLINARY EFFORT,' BY E.D. RAHUBKA, ET AL.),
Corps of Engineers, San Francisco, Calif. South Pacific Div.
P. F. Dunn.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 309-311, 1975.

Descriptors: *Water resources development, *Comprehensive planning, Social aspects, Environmental engineering, Economics, Alternative planning, Water quality, Flood control.

LIBRARY U. OF I. URBANA, ILLINOIS

Identifiers: *Interdisciplinary analysis, *Plan formulation, Satisfaction level, Choice approach.

The paper by E. D. Rahubka, et. al provides an excellent case study of the type of social experiment faced by miltidisciplinary planning teams and shows clearly how mistaken it would be to allow a single discipline to attempt to solve such problems. This brief discussion critizes the plan formulation aspects of the study, while considering the fields of environmental engineering, economics, and political science. The author's comments focus on the setting and reaching of minimum acceptable satisfaction levels, and tough on flood protection, environment restoration benefits, water treatment, and double counting of benefits. DISCUSSION (OF, 'CORPS URBAN PLANNING IN ST. LOUIS-MALINE CREEK: AN INTERDISCIPLINARY EFFORT,' BY E.D. RAHUBKA, ET AL.),
Idaho Univ., Moscow.
E. L. Michalson.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 312-319, 1975.

Descriptors: *Water resources development, *Comprehensive planning, Urban sociology, Watersheds(Basins), Methodology.
Identifiers: *Interdisciplinary analysis, *Maline Creek(Mo), Improvements.

The Maline Creek planning effort is criticized and suggestions for improvement are offered. In general, more studies of this type should be done by the Corps across the country. The methodology is a commendable attempt to derive a procedure permitting public participation in the planning process. However, there exist a number of weaknesses: (1) a statement of the study objectives was omitted; (2) the scope was perhaps too broad and complex; (3) the study was multidisciplinary rather than interdisciplinary; (4) the status quo condition should have been considered as a planning alternative in order to determine the acceptance of the alternative improvment plans; (5) there were no numerical examples in the narrative; (6) the terminology used in the section referred to as Potential Synergistic Social Effects should have been further defined; and (7) there was no sociologist or political scientist in the planning group, thus weakening the section on social effects. Despite the weaknesses, a beginning was made in the integration of technical expertise and public involvement in the planning process, holding some promise for the future. WATER INTAKE UNDER CENTER-PIVOTS FROM TIME-VARYING APPLICATION RATES,
Nebraska Univ. Lincoln. Dept. of Agricultural Engineering.
J. W. Addink, D. L. Miles, and G. V. Skogerboe.
Tranactions of the American Society of Agricultural Engineers, Vol 18, No 3, p 523-528, May-June 1975. 4 fig, 3 tab, 14 ref.

Descriptors: *Irrigation, *Infiltration rates, *Sprinkler irrigation, *Rates of application, Application methods, Runoff, Sprinkling, Soils, Irrigation systems, Model studies, Mathematical models, Laboratory tests, Irrigation practices, Infiltration, Agriculture.
Identifiers: *Time-varying application rates, Center-pivot irrigation systems.

Design considerations of center-pivot sprinkler systems are different than those for conventional systems. Stationary sprinkler system design is primarily concerned with uniformity of water application. Sprinklers are selected so that application rates do not exceed intake rates. Center-pivot systems can easily have good application uniformities because of continually moving laterals and overlapping of many sprinkler patterns. However, the application rates of center-pivots sometime exceed the intake rates especially towards the end of the lateral. Resulting runoff moves from high spots and slopes to nearby low spots causing uneven water itake. Laboratory and model water-intake tests of application-rate patterns designed to reduce runoff were reported. Conclusions were: (1)forward-skewed application patterns have potential for reducing runoff under center pivots by 11% or more, and (2)percent reduction of runoff depends on the slope of the pattern and the soil type. (Sims-ISWS)

THE RELATIONSHIP BETWEEN SOLAR RADIATION, SOIL WATER, AND WATER POTENTIAL OF EARS OF WHEAT,
Lincoln Coll. (New Zealand). Dept. of Plant Science.
C. T. Dougherty.
New Zealand Journal of Agricultural Research, Vol 17, No 4, p 459-463, November 1974. 2 fig, 2 tab, 11 ref.

Descriptors: *Soil water, *Moisture tension, *Solar radiation, *Wheat, Crop response, Plant growth, Irrigation effects, Irrigation, Crop production.
Identifiers: Water potential of ears of 'Kopara' wheat grown in the field with or without irrigation were measured by pressure bomb between 0900 and 1000 h and related to soil water and solar radiation. Water potentials of ears from irrigated wheat ranged from -2 to -14 bars, and from -8 to -27 bars in ears from non-irrigated plots. Ear water potentials between 0900 and 1000 h were related to soil water percentage and mean solar radiation received between 0700 and 0800 h. (Skogerboe-Colorado State)

EFFECTS OF IRRIGATION AND FERTILISER ON THE YIELDS OF 'ARAWA', 'AOTEA', AND 'KARAMU' WHEATS,
Lincoln Coll. (New Zealand). Dept. of Plant Science.
C. T. Dougherty, W. R. Scott, R. H. M. Langer, and G. Meijer.
New Zealand Journal of Agricultural Research, Vol 17, No 2, p 241-249, May 1974. 3 fig, 5 tab, 30 ref.

Descriptors: *Fertilization, *Fertilizers, *Irrigation practices, *Wheat, Irrigation effects, Plant growth, Nitrogen, Agronomic crops.

Grain yields of 'Aotea', 'Arawa', and 'Karamu' wheats were depressed by irrigation during early stages of reproductive development which reduced the number of grains per spikelet and slowed the rate of reproductive development. Nitrogen fertilizer increased the ear population at harvest but had little effect on the dry weight or leaf area of the tillers during the critical pre-anthesis stage or on the mean values of the components of yield of the ears. There were no interactions between fertilizer and irrigation treatments. 'Karamu', a Mexican semi-dwarf, was similar to the New Zealand-bred wheats except that it had slightly more spikelets per ear and grains per spikelet, but it had smaller grains. An antitranspirant applied to irrigated wheat had no effect on any of the components of grain or straw yield. Responses were interpreted on the basis that pre-anthesis assimilate levels were modified by agronomic treatments and affected grain set. (Skogerboe-Colorado State)

AN ANALYSIS OF A NITROGEN-INDUCED DEPRESSION OF YIELD IN IRRIGATED 'KOPARA' WHEAT,
Lincoln Coll. (New Zealand). Dept. of Plant Science.
C. T. Dougherty, and R. H. M. Langer.
New Zealand Journal of Agricultural Research, Vol 17, No 3, p 325-331, August 1974. 2 fig, 7 tab, 20 ref.

Descriptors: *Fertilization, *Fertilizers, Moisture tension, Nitrogen, *Wheat, Crop response, Plant growth.

Heavy applications of nitrogen fertilizer (200 kg/ha) applied in early spring to wheat on a Wakanui silt loam, in which irrigation was used to maintain soil-water levels above -0.5 bar, depressed grain yield by 30%. Poor grain set was the main cause of the low yields, but mean grain weights were also reduced. Analysis of data indicated that grain set was probably restricted by the availability of carbohydrate during the critical pre-anthesis period of floret development. (Skogerboe-Colorado State)
W76-00152

PREDICTING NITROGEN FERTILIZER REQUIREMENTS AFTER LAND LEVELING,
Agricultural Research Service, Weslaco, Tex.
J. R. Thomas, M. D. Heilman, and L. Lyles.
Agronomy Journal, Vol 66, No 3, p 371-374, May-June, 1974. 5 fig, 4 tab, 6 ref.

Descriptors: Fertility, Fertilization, *Fertilizers, *Land forming, Land reclamation, Land development, Crop response, *Nitrogen, *Crop production.

Reduced yields and nutrient-deficient crops on cut areas after land leveling are recognized problems. The objectives of this study were to determine if the variability in crop production between cut and fill areas of leveled fields could be minimized without overfertilization by adjusting the soils to a uniform level of available N based on the soils' capacity to supply N (N index) and to relate the N fertilizer requirement to the N index. Five leveling methods which resulted in the removal of different amounts of top soil were used. Soils from leveled and nonleveled areas were incubated and the soils' capacity to supply N were described by a regression model. With a 14-day incubation, the nonleveled soils supplied N at the rate of 174 kg/ha. Therefore, based on the leveled soils' ability to supply N in this time period, sufficient NH4NO3 fertilizer was applied to establish N levels of 174, 219, and 263 kg/ha. The leveled fields were cropped to forage sorghum. Dry matter forage yields, N uptake, and the growth rate during the first 19 days of growth were significantly related to the N index. (Skogerboe-Colorado State)

INFLUENCE OF ORGANIC NITROGEN ON SOIL NITROGEN, NODULATION, NITROGEN FIXATION, AND YIELD OF SOYBEANS,
Maryland Univ., College Park. Dept. of Agronomy.
D. F. Bezdicek, R. F. Mulford, and B. H. Magee.
Soil Science Society of America Proceedings, Vol 38, No 2, p 268-273, March-April, 1974. 2 fig, 5 tab, 17 ref.

Descriptors: *Fertilization, Nitrogen, Nitrogen fixation, *Soybeans, Crop response.
Identifiers: Nodulation, Organic nitrogen, Rye, Soil nitrogen.

Nitrogen was applied on a previous rye cover crop for later determination of the effect of organic N on soybean, N2-fixation rate, plant dry matter, N uptake, and yield. Nitrogen was applied at 0, 56, 112, and 224 kg N/ha as NH4NO3 or urea either on rye in mid-March or at soybean planting time in a 4 x 2 x 2 factorial design. In both years of study, N2-fixation rate as estimated from acetylene reduction was reduced throughout the season by increased fertilization rate. For 1 year, interactions shows that N2-fixation rate and nodule mass were stimulated late in the season from increased N fertilizer appled to the rye but not at soybean planting. Interactions between NH4NO3 and urea and time of application showed that NH4NO3 as compared with urea applied on rye significantly increased soybean dry matter, N uptake, and yield. Urea applied at planting increased these paramters in comparison with NH4NO3. The observed increases in dry matter, N uptake and yield from rye-applied NH4NO3 were not accompanied by a corresponding increase in N2-fixation rate or nodule mass. This would suggest that the N2 fixing system was not responsible for the increase of dry matter, N-uptake, and yield. Soil organic N was not measurably influenced by the treatments imposed. (Skogerboe-Colorado State)

Canadian Agricultural Engineering, Vol 16, No 2, p 51-57, December 1974. 4 fig, 6 tab, 7 ref.

Descriptors: *Sprinkler irrigation, *Irrigation practices, Irrigation systems, Evaluation, Consumptive use, Cost analysis, Crop production.

Maximum production under irrigation requires a system with the capacity to meet the peak water requirements of the plant. Surface irrigation systems, particularly the border dyke method fed by gravity water, are designed and operated so that elapsed time required to irrigate a field (Irrigation cycle) is much shorter than the elapsed time between irrigations (Irrigation interval). Sprinkler irrigation systems, irrigatin interval is used for the irrigation cycle. The main reason for this is one of economics. The cost of the system is decreased as more of the available irrigating time is used for irrigating. The purpose of this study was to examine the yields and economic ramifications of using a sprinkler irrigation over a larger area than that determined by the normal criterion of designing the system to meet peak water requirements. (Skogerboe-Colorado State)

IMPROVEMENT OF WATER APPLICATION OF SELF-PROPELLED SPRINKLER IRRIGATION SYSTEMS,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
A. D. Barefoot.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-245 762, $3.25 in paper copy, $2.25 in microfiche. Completion Report, (1975). 17 p, 3 fig, 7 tab, 10 ref. OWRT A-040 OKLA(1). 14-31-0001-4036.

Descriptors: *Irrigation systems, *Sprinkler irrigation, *Uniformity coefficient, Trafficability, *Evapotranspiration, Evaporation, Winds, Root zone, *Oklahoma.
Identifiers: Center-pivot sprinkler irrigation.

The number of center-pivot sprinkler irrigation systems is increasing in the central Great Plains. The reason for this increase are their labor-saving advantages and versatility. The system's ability to irrigate rolling terrain with a wide range of application depths accounts for its versatility. The objectives of this project were to evaluate the depth and uniformity of application of a center-pivot system and to determine the depth of water stored in the crop root zone, evaporation losses and trafficability problems of a typical system during field conditions. Data were collected from a 1300 foot, electrically driven system. Both size and spacing of the nozzle heads are varied to obtain desired application rates on this system. The soil type was sand and the crop was peanuts. The average coefficient of uniformity was 85.2 with a standard deviation of 2.48. The uniformity appeared to decrease linearly with wind speed for the range tested. The average value of evapotranspiration was 0.186 inches per day for the entire growing season. The average evaporation loss was 15.5 percent with 20.4 percent occuring during daytime irrigations and 10.6 percent at night. No trafficability problems were encountered on the sandy soil. Five systems were tested in the Oklahoma Panhandle. The systems varied in both design and lengths. Three of the systems were electrically powered and two were water driven. The average coefficient of uniformity for the five systems was 81.7. Only minor traction problems were observed in the clay loam or loam soils.

Aricona Univ., Tucson. Dept. of Agricultural Economics.
N. G. Wright, E. R. Barmettler, T. M. Stubblefield, and D. A. Swope.
University of Arizona, Agricultural Experiment Station, Technical Bulletin 217, June, 1975. 28 p, 1 fig, 15 tab, 2 ref, 15 append.

Descriptors: *Cost comparisons, *Estimated costs, *Farm management, *Crop production, *Irrigation, Costs, Comparative costs, Prices, *Nevada, Agriculture, Alfalfa, Arable land, Cereal crops, Crops, Farm prices, Hay, Irrigated land, Irrigation efficiency, Southwest U.S., Budgeting, Semiarid lands.

Costs of producing crops in Nevada were determined in such a manner as to be comparable with similar costs in other states. A synthetic budgeting method was used, and costs were based on the more efficient uses of agricultural inputs, at 1972 prices. Of the approximate 500,000 acres of irrigated cropland in Nevada, in 1970 and 1971, about 88 percent was hay, 4 percent alfalfa seed, and about 6 percent grain. Production cost estimates for alfalfa hay in northeastern Nevada were $33.80/ton, in western Nevada $31.81, and $31.87 in southern Nevada. The northeast was the highest cost area, producing hay and small grains to feed livestock through the winter. There was not enough difference in cost among areas to encourage any production shift from one area to another. (Robinett-Arizona)

Descriptors: *Soil moisture, *Proteins, *Nitro *Wheat, Beans, Moisture content, *Crop proc tion, Crop response.
Identifiers: *Kidney beans.

Under vegetative conditions the authors obser the effect of soil moisture (Minimal, normal increased) on protein nitrogen fraction retentio wheat and kidney bean. Minimal and increa moisture had a negative effect, lowering the re tion of protein fractions. Increased moisture of soil has a particularly negative effect as compa to minimal and normal moisture. In wheat du optimal moisture there is an increase hydrophilous colloids and their hydration ar higher yield of grain. In plants grown on inst cient and overabundant soil moisture no cor tion was found between hydrophilous colloids yield and moisture of the soil.--Copyright 1 Biological Abstracts, Inc.

PREDICTION OF PLANT RESPONSE TO F TILISERS BY MEANS OF SOIL TESTS,
Department of Agriculture, Mosgiel (New land). Invermay Agricultural Research Center.
J. L. Grigg, and R. C. Stephen.
New Zealand Journal of Agricultural Resea Vol 17, No 1, p 31-40, February 1974. 1 fig, 7 15 ref.

Descriptors: *Fertilizers, *Fertilization, * response, *Soil tests, Wheat, Phosphate, production, Plant growth.

Data from 82 rates-of-fertilizer trials on whea which double superphosphate was the sourc phosphate, were used to evaluate the predict ty of grain yield responses from soil-test meas ments. Yield data were reduced to single va for correlations with soil phosphorus tests by culating (a) relative yields % and (b) the first cipal components of the yield response. Re sion of these parameters on values from eigh ferent soil tests, using a quadratic model ir square root scale, showed that the Olsen soi modified to 16-h extraction and a soil: solu ratio of 2.2 ml: 100 ml accounted for more va tion than other soil tests examined. The co tions with soil tests were closer for the rel yields than for the first principal compon (Skogerboe-Colorado State)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

ANALYSIS OF FLOW THROUGH VEGETATION,
Florida Univ., Gainesville. Dept. of Civil and Coastal Engineering.
S. Petryk, and G. Bosmajian, III.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY7, Paper 11457, p 871-884, July 1975. 9 fig, 15 ref, 2 append.

Descriptors: *Vegetation, *Vegetation effects, *Open channel flow, Flow resistance, Flow around objects, Flow friction, Aquatic weeds, River flow, Streamflow, Mannings equation, Drag, Flood plains, Roughness coefficient, Model studies, Channels.
Identifiers: Flow through vegetation, Vegetation density, Vegetation roughness.

The Manning n value was quantitatively evaluated for flow in heavily vegetated channels. Momentum analysis showed that the composite n value as a function of flow depth is dependent on the bottom roughness and the density of vegetation. In some cases, the vegetation density can be evaluated directly from physical measurements of the vegetation. However, in most situations, it must be evaluated indirectly from limited field data. The results showed that the n value increases in proportion to two-thirds power of the hydraulic radius for conditions where the vegetation density is a constant over the flow depth. Field application of the flow resistance model were described for projects concerned with flood routing, backwater computations, extension of rating curves, channel improvement work, and erosion control. INTERDISCIPLINARY STUDIES OF LARGE RESERVOIRS IN AFRICA,
Colorado Univ., Boulder.
G. F. White.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 63-85, 1975. 3 fig, 2 tab, 5 ref.

Descriptors: *Water resources, *Reservoirs, *Africa, Effects, Social impacts, Rivers, Ecosystems, United Nations, Design, Operations, Mathematical models.
Identifiers: *Interdisciplinary studies, *Man-made lakes, Impact analysis, Prediction, Salvage studies, Agencies.

The need to salvage maximum social benefits from reservoirs previously constructed primarily for hydroelectric power purposes initiated four interdisciplinary investigations of the effects of man-made lakes in Africa, under way since the mid-1960's. The reservoirs are the Kariba on the Zambezi, the Nasser on the Nile, the Kainji on the Niger, and the Volta on the Volta River. In each case, the United Nations Development Programme joined with the responsible national group to support investigations which included the assessment of likely effects of the reservoir on social systems and the alternative measures open to deal with such effects. The principal effects included dislocation, human health, agricultural productivity, fishing, wildlife resources, and recreation. The major disciplines involved in the resulting scientific investigations included anthropology, aquatic biology, terrestrial biology, fisheries, economics, geography, engineering, limnology, and sociology. Among the problems encountered in carrying out such investigations effectively were the divisions of administrative authorities, the conflicts among responsible local and national agencies, the lack of a language for scientific communication, the difficulty of relating basic investigations to the likely application of results, and the transitory nature of the investigations. DISCUSSION (OF, 'INTERDISCIPLINARY STUDIES OF LARGE RESERVOIRS IN AFRICA,' BY G. F. WHITE),
Engineering-Science, Inc., Cincinnati, Ohio.
R. M. Males.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 86-94, 1975.

Descriptors: *Communication, *Information exchange, *Water resources, Africa, Evaluation, Value, Projects, Ethics, Reservoirs.
Identifiers: *Interdisciplinary studies, Salvaging, Reporting.

Males discusses the character and value of communication about interdisciplinary studies and makes recommendations for what he feels should be communicated. He uses White's paper, 'Interdisciplinary Studies of Large Reservoirs in Africa,' to elucidate and support his own contentions. At present, the majority of knowledge in interdisciplinary studies is experimental; since it is difficult to comment on others' experiential knowledge, a major effort should be to discover what can legitimately be talked about in this field. Considered are the ethics of work and reporting in this field; also considered are traditional disciplinary studies and reporting. Meaningful interdisciplinary studies of significant problems involve the question of distribution of power, both within political/social institutions and between/within disciplines. White discusses the difficulties of keeping project team members problem-, rather than process-, oriented. White's experiences support Males' contention that according all disciplines equal status and making all efforts group, or team, efforts, is not workable. White's points on reliability of analysis and routes to goals cannot be overemphasized. Males criticizes that White gives unfamiliar references (a problem inherent in interdisciplinary reporting) and uses figures (diagrams) not of his own creation. Three basic arenas for communication/information transfer relative to interdisciplinary studies are: (1) awareness of what we are doing (i.e., social optimum); (2) development of guiding principles and unifying concepts; and (3) tools (hardware, software, and people). CEDAR CREEK AT CEDARTOWN, GEORGIA--FLOOD FLOW CHARACTERISTICS AT BRIDGE SITE OF GEORGIA AVENUE RELOCATION (SUPPLEMENT TO OPEN-FILE REPORT 75-46),
Geological Survey, Doraville, Ga.
M. Price.
Open-file report 75-332, July 1975. 6 p, 3 fig, 1 tab.

Descriptors: *Flood data, *Flood frequency, *Flood forecasting, *Highway relocation, *Georgia, Hydrologic data, Streamflow, Flow characteristics, Flood plains, Road construction, Planning.
Identifiers: Cedartown(Ga), *Cedar Creek(Ga).

This report shows changes made after the May 1974 U. S. Geological Survey open-file report 75-46 'Cedar Creek at Cedartown, Georgia, Floodflow Characteristics at Georgia Avenue, Relocation and Canal Street Extension,' prepared at the request of the Georgia Department of Transportation. The original report described the hydraulic characteristics of the Georgia Avenue relocation as constructed in April 1974, and evaluated the effects of three proposed changes in roadway grades at this crossing. The purpose of the change in the roadway and side road grades is to reduce the backwater effect of the highway crossing so that the 5-year flood (6,700 cfs) will produce backwater less than 0.1 foot and the 50-year flood (13,000 cfs) will produce backwater less than 0.5 foot. The backwater effect of the April 4, 1974 flood (12,700 cfs) was determined from field surveys and is used as the approximate 5-year flood because availability of accurate field data. The 50-year flood was estimated to be 13,200 cfs from a frequency curve. (Woodard-USGS)

INFLUENCE OF PRECIPITATION ON PERENNIAL GRASS PRODUCTION IN THE SEMIDESERT SOUTHWEST,
Forest Service (USDA), Tucson, Ariz. Rocky Mountain Forest and Range Experiment Station.
D. R. Cable.
Ecology, Vol 56, p 981-986, Summer, 1975. 1 fig, 4 tab, 13 ref.

Descriptors: *Semiarid climates, *Range grasses, *Rainfall, *Water requirements, *Plant growth, *Southwest U. S., *Arizona, *Grasses, Grasslands, Deserts, Range management, Wet seasons, Meteorology, Weather, Water supply, Shrubs, Mesquite, Desert plants.
Identifiers: *Perennial grasses, Santa Rita Experimental Range(Ariz), Grass production, Perennial grass production, Rainfall effects.

Perennial grass production in the semidesert grass-shrub type was dependent primarily on current summer rainfall and previous interaction effect, not a direct effect. The best overall relationship involved current August rainfall, previous June through September rainfall, and the interaction product of these two. However, an interaction product alone yielded estimates essentially as good as the multiple regression, and explained 64%-91% of the year-to-year variability in grass production. Winter precipitation had no consistent effect on perennial grass production the following summer. The depressing effect of mesquite on perennial grass production was most noticeable at low rainfall levels, and became minor at high rainfall levels. (Robinett-Arizona)

EVALUATION AND IMPLEMENTATION OF URBAN DRAINAGE PROJECTS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
N. S. Grigg.
Journal of the Urban Planning and Development Division, Proceedings of ASCE, Vol 101, UP1, p 61-75, May, 1975. 6 fig, 1 tab, 32 ref, append.

Descriptors: *Urban drainage, *Cities, *Flood control, *Project planning, Cost-benefit analysis, Urbanization, Drainage systems, Administration, Decision making, Financing.

The service that urban drainage and flood control systems (UDFC) provide to urban areas has three basic components: flood control; convenience drainage; and, environmental sanitation. Since this service is provided by local governments it must compete for public funding with other more visible programs such as education, transportation, and public safety. This paper details the practical aspects of evaluating an urban drainage and flood control project. The evaluation problem must consider the merit of individual UDFC systems, the ranking of competing UDFC projects, the optimal investment timing, and the incidence of UDFC benefits and costs. UDFC systems are considered to be either minor systems, which provide for the drainage of frequent runoff events, or major systems, which provide for the rarer and more severe events. Financial savings can be realized by cities which use valid and incisive evaluation techniques in the planning, programming and budgeting steps of urban drainage and flood control projects. SKEW INPUTS AND THE HURST EFFECT,
Ain Shams Univ., Cairo (Egypt).
A. A. Anis, and E. H. Lloyd.
Journal of Hydrology, Vol 26, No 1/2, p 39-53, July 1975. 3 tab, 9 ref.

Descriptors: *Statistical methods, *Reservoir storage, *Withdrawal, *Time series analysis, *Analytical techniques, Distribution patterns, Hydrologic data, Frequency, Inflow, Model studies, Geophysics.
Identifiers: *Hurst effect, Skew inputs.

Hurst plotted values of logarithms of rescaled Hurst range versus the logarithm of years of record, n, and determined an expression for this range by passing the fitted line through the origin. The results would have been more general if the intercept had been kept independent of the Hurst exponent and allowed to vary from one set of data to the other. For models in which annual flows are identically distributed independent random variables, the logarithm of range varies with the logarithm of n only for rather large values of n, the slope of the line being 0.5. Extrapolation backward of the fitted line yields an intercept independent of the Hurst exponent. The conformity of a mathematical model to Hurst's empirical law is not determined by its asymptotic properties but rather by its behavior over the relevant interval of finite n-values, say 100 to 1000 years. For gamma-distributed inflows with appropriate shape parameter, the adjusted range of cumulative sums has a local Hurst exponent in the neighborhood of 0.75 over the desired time interval. Attention w drawn to the desirability of investigating whethe similar result might hold for the rescaled range these inputs. (Singh-ISWS)

Identifiers: Chase County(Neb), Dundy C ty(Neb).

Use of groundwater for irrigation in Chase Dundy counties, Nebraska, has increased tren dously during the past two decades. At the tim an earlier study (1953), less than 70 irrigation w had been drilled in the area; but when this st was made (1973), nearly 1000 irrigation wells been registered. The Ogallala Formation Pliocene age is the source of virtually all the w pumped; alluvial deposits supply the s remainder. An estimated 177,000 acre-fee water was pumped for irrigation in 1973. Grou water withdrawals to date have caused the w table to decline more than 10 feet in two areas, in the vicinity of Chase and Lamar in Chase C ty and the other in north-central Dundy Cou Because water levels have lowered throughc large part of the area drained by French Creek, the point at which the creek becomes a stream has migrated downstream and the flow of the creek has decreased. Part of the lo ing of water levels is probably due to less-t normal precipitation in recent years. (Sims-ISW

TRANSIENT WELL-FLOW IN AN UNCONFINED-CONFINED AQUIFER SYSTEM,
Indian Inst. of Tech., Madras. Hydraulic Engineering Lab.
M. H. A. Khader, and M. K. Veerankutty.
Journal of Hydrology, Vol 26, No 1/2, p 123-140, July 1975. 8 fig, 2 tab, 21 ref.

Descriptors: *Groundwater, *Unsteady flow, *Confined water, *Mathematical studies, Aquifers, Drawdown, Aquifer testing, Numerical analysis, Potentiometric level, Equations, Groundwater movement, Water wells, Wells, Mathematics, Hydraulic properties, Laplaces equation, Dual system, Water table.
Identifiers: Type curves, Drawdown distribution, Multi-layered aquifers.

Equations for transient flow to a well penetrating two aquifers--a water table aquifer overlying a confined aquifer--were derived. Two cases were considered for analysis. In the first case, flow towards a well of zero discharge with different initial heads was analyzed. In the second case, the solution was obtained for a well penetrating two aquifers with a constant discharge and identical initial heads. Schapery's method of inversion for Laplace transform was used in the analysis. Solutions of these two cases were combined to obtain general solutions for different field conditions. From the equations derived, it was also possible to calculate the contributions from individual aquifers to the total discharge. Important results of the analysis were given in tables and charts using the usual range of values of different parameters. (Prickett-ISWS)

INTERDISCIPLINARY APPROACH TO GEOTHERMAL DEVELOPMENT,
Bureau of Reclamation, Boulder City, Nev. Regions.
M. K. Fulcher.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 194-208, 1975.

Descriptors: *Geothermal studies, *Water resources development, *Environmental effects, Water supply, Saline water, Drilling, Subsidence, Water quality, Energy, Electric power, Ecology, Brines, Wells, Alternative planning, Colorado River.
Identifiers: *Interdisciplinary analysis, *Imperial Valley(Cal), Production water, Bureau of Reclamation.

Geothermal systems provide the potential to meet pressing water and power demands of the near future. Considered is the study and development of geothermal resources, focusing on the necessity for broad interdisciplinary analysis. To relate the need for an interdisciplinary approach to a specific case, the Bureau of Reclamation's geothermal resources investigation in Imperial Valley, California is described. In the Imperial Valley, and in the vast majority of know geothermal deposits, heat is stored as hot fluid, providing the potential for economical new supplies of fresh water through desalting, concurrent with the production of electricity. The Bureau's concept for development here involves three stages. Stage one would, through extensive geological, geophysical, and water chemistry investigations, determine the potential and extent of the geothermal resource. Stage two would demonstrate the feasbility of a large-scale development. In the third state, large-scale development, the flows of the Colorado River would be augmented by as must as 2.5 million acre-feet of desalted water annually with electric power production of about 10,000 megawatts. Considered is the broad spectrum of technical, environmental, and social factors involved in such a development plan. A lead agency can continually coordinate the comprehensive, interdisciplinary input. Thus, a true evaluation can be made of the cumulative impacts resulting from geothermal resource development. Insights from all disciplines are essential for most effective development and for a realistic and comprehensive perspective of alternatives. (See also W76-00060) (Bell-Cornell)
W76-00070

DISCUSSION (OF, 'INTERDISCIPLINARY APPROACH TO GEOTHERMAL DEVELOPMENT,' BY M. K. FULCHER),
California Univ., Los Angeles.
E. A. Engelbert.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 209-219, 1975.

Descriptors: *Geothermal studies, *Planning, *Regions, Economics, Social aspects, Legal aspects, Water policy, Energy, Costs, Research and development, Coordination, Effects, *California.
Identifiers: *Interdisciplinary analysis, *Imperial Valley(Cal), Environmental impact statements.

In response to M. K. Fulcher's paper, Engelbert focuses upon the need for social-economic analysis concerning policies that should govern geothermal resources development in southeastern California before major development gets under way. Engelbert recommends this approach over that of Fulcher, who concentrates on socio-economic analysis of what the after-consequences may be. According to Engelbert, it is the policies which will govern the commencement of large-scale geothermal development which will in turn greatly determine the subsequently ensuring undesirable socio-economic impacts. Considered herein are some of the major policy issues which urgently need to be pursued and answered. Included are legal considerations, development policies, energy policy, water policy, and regional planning and coordination. The author is in full agreement with Fulcher's statement that 'the insights from all disciplines are essential for most effective development and for a realistic and comprehensive perspective of alternatives'. Most critical for public policy now, believes Engelbert, is sorting out priorities and options before major development begins so that the nation will derive optimum benefits from this resource. EVALUATION OF A PROPOSED CONNECTOR WELL, NORTHEASTERN DESOTO COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
C. B. Hutchinson, and W. E. Wilson.
Available from National Technical Information Service, Springfield, Va 22161 as PB-237 633, $3.75 printed copy; $2.25 in microfiche. Water-Resources Investigations 5-74, July 1974. 41 p, 7 fig, 6 tab, 10 ref, 2 append.

Descriptors: *Artificial recharge, *Water conservation, *Evapotranspiration control, *Groundwater recharge, *Florida, Fruit crops, Citrus fruits, Model studies, Forecasting, Water storage, Aquifer characteristics, Hydraulic conductivity, Recharge wells, Water management(Applied).
Identifiers: *Connector wells, *Floridan Aquifer, Captured water.

At a 24,000 acre citrus grove in northeast DeSoto County, Florida, a connector well is proposed as a resource-management tool for capturing water normally lost through evapotranspiration and by excess runoff. Such a well would connect the surficial sand aquifer with the deep, highly transmissive limestone Floridan Aquifer. Because of natural head differences, water would move by gravity flow from the sand into the Floridan Aquifer, thus replenishing water withdrawn for irrigation from the Floridan Aquifer. A 70-acre marsh was selected as the test site based on analyses of hydraulic conductivity, porosity, and water quality. Recharge rate through the connector well under steady-state conditions is estimated at 160 gallons per minute. The proposed connector well is designed to have 10-inch screens opposite zones in the 45-foot thick sand aquifer, be cased for 400 feet opposite confining beds and a secondary limestone aquifer, and be open hole for about 250 feet in the Floridan Aquifer. A graded-sand filter pack placed around the screened sections of the well will increase its efficiency. (Woodard-USGS)

GROUND-WATER RECHARGE RATES FROM THERMOMETRY,
Agricultural Research Service, Fresno, Calif.
H. I. Nightingale.
Ground Water, Vol 13, No 4, p 340-344, July-August 1975. 5 fig, 4 tab, 12 ref.

Descriptors: *Groundwater, *Recharge, *Temperature, *Recharge ponds, *Water temperature, *California, Air temperature, Percolating water, Fourier analysis, Percolation, Seepage, Infiltration, Groundwater movement, *Artificial recharge, Statistics.
Identifiers: *Leaky Acres Recharge Project(Calif), *Flow velocities, *Falling head method, *Thermometry.

Basin artificial groundwater recharge rate at the Leaky Acres Recharge Project in Fresno, California, was evaluated by Fourier analysis of temperature variations of air, basin water, and groundwater. The weekly mean basin water temperature correlated well (r=0.982) with weekly mean air temperature. Weekly mean temperature data of the air, basin water, and recharged groundwater showed that the first harmonic curve was satisfactory for determining the times of minimum and maximum temperature when convective transfer of heat was considered. The lag time between maximum basin water temperature and maximum groundwater temperature at a 16 m depth, showed water moved at a thermal tracer velocity of 20.8 cm/day. The corresponding infiltration rate measured by the falling-head method in study area basins was 18.5 cm/day. This indicated that under suitable conditions with simple field instrumentation groundwater thermometry can be used to estimate the rate and direction of recharged water movement. (Prickett-ISWS)

UPCONING OF THE SALT-WATER--FRESH-WATER INTERFACE BENEATH A PUMPING WELL,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
R. L. Chandler, and D. B. McWhorter.
Ground Water, Vol 13, No 4, p 354-359, July-August 1975. 6 fig, 1 tab, 9 ref.

Descriptors: *Saline water-freshwater interfaces, *Water wells, *Penetration, Pumping, Saline water, Water table, Anisotropy, Isotropy, Optimization, Permeability, Entrainment, Dupuit-Forchheimer theory, Mathematical models, Model studies, Numerical analysis, Boundaries(Surfaces), Equations, Density, Pressure head, Discharge(Water).
Identifiers: *Upconing, *Partial penetration, Permeability ratio, Chyben-Herzberg approximation, Critical discharge, Transition zone, Iteration, Implicit numerical technique.

The upconing of saline water in response to pumping from an overlying layer of fresh water was investigated by numerical integration of the governing differential equation. The transition zone between the fresh and saline water was idealized as an abrupt interface. Full consideration of the nonlinear boundary conditions on the water table and interfacesurface was included for steady flow toward partially penetrating pumping wells in both isotropic and anisotropic aquifers. There exists an optimum well penetration into the fresh-water layer which permits maximum discharge without salt- water entrainment. The optimum penetration increases as the vertical permeability is reduced relative to the horizontal permeability. The maximum well discharge obtainable withour salt-water entrainment is greater for aquifers with a reduced vertical permeability than for isotropic aquifers, a result that contrasts with previously published conclusions. Previous analyses which linearize the boundary condition on the interface overestimated the critical discharge (Visocky-ISWS)

THE OCCURRENCE AND DEVELOPMENT OF GUEST SINK, HERNANDO COUNTY, FLORIDA,
Southwest Florida Water Management District, Brooksville.
B. A. Boatwright, and D. W. Allman.
Ground Water, Vol 13, No 4, p 372-375, July-August 1975. 4 fig, 2 ref.

Descriptors: *Sinks, *Collapse, *Karst, *Flori[da], Caves, Water table, Potentiometric level, Obs[er]vation wells, Land subsidence, Crat[ers], Geomorphology, Drainage, Swamps, Sprin[gs], Transmissivity, Carbonate rocks, Drilling, Sa[fety] value, Replacement costs, Saline water fr[om] water interfaces, Chlorides, Monitoring.
Identifiers: *Chassahowitzka Swamp(Fla), *Gu[lf] sink(Fla), *Floridan aquifer, Catastrophes, C[ol]ing, Satellite sinks.

The spectacular occurrence of a sinkhole near t[he] Gulf Coast of Florida engulfed a well drilling r[ig], water truck, and a load of PVC pipe on a trailer [in] within less than 10 minutes. The 150-foot diame[ter] sinkhole, which was initially dry and extended [to] depth of 59 feet below mean sea level, develo[ped] suddenly on September 19, 1974. This occur[red] during the drilling of a 6-inch well in Hernan[do] County, about 5 miles inland from the Gulf [of] Mexico at a land surface elevation of 11 feet ab[ove] mean sea level. The sinkhole, which displa[ced] 6500 cubic yards, began to develop when the [drill] bit entered a cavity at a depth of 202 feet. [Nu]merous satellite sinks ranging up to 20 fee[t] diameter occurred simultaneously with [the] development of the parent sink. Within 24 ho[urs] groundwater discharge into the parent sink fr[om] the shallow, unconfined and unconsolida[ted] aquifer had filled the sink to an elevation of 8 [ft] above mean sea level. The total estimated repla[ce]ment cost of the equipment lost in the sinkhol[e] $120,000. (Visocky-ISWS)

Identifiers: *England, *Gravity drainage.

Using a combination of field and labora[tory] techniques, the formation constants and bou[nd]aries of a fissured aquifer (the Penrith Sandst[one] have been determined at Cliburn, Westmorel[and]. Groundwater movement appears to take p[lace] primarily along horizontal fissures which are [well] developed near the water table. Initial respon[se] pumping is that of a fissured, unconfined aqu[ifer] with subsequent gravity drainage occurring w[hen] drawdown is sufficient to overcome the capi[llary] suction of a cemented unit just above the w[ater] table. Two barrier boundaries, presumed t[o be] faults, further complicate the analysis. Trans[mis]sivity is unusually high, and the aquifer appea[rs to] have considerable potential for a water su[pply]. Further study is necessary, however, on th[e re]gional water balance and on the vertical and la[teral] variations of transmissivity and storage co[effi]cient. (Visocky-ISWS)

DESIGN AND FABRICATION OF A BORE-HOLE LOGGING DEVICE FOR USE IN GROUND WATER OPERATIONS,
Indian Inst. of Tech., Kanpur. Dept. of Civil Engineering.
K. V. G. K. Gokhale.
In: International Symposium on Development of Ground Water, November 26-29, 1973, Madras, India, Vol 1, pIb 27-Ib31, 4 fig, 5 ref.

Descriptors: *Thermal stratification, *Logging(Recording), Well data, Locating, Borehole methods, Subsurface, Aquifers, Geophysics.
Identifiers: *Temperature logging, Hydro-geologic parameters.

A temperature logging unit for use in bore holes in ground water investigations was designed and fabricated. The temperature is determined by the variation in resistance of the circuit in the device. The circut diagram and the details of operation for this instrument are provided. A temperature log from a known borehole is presented. The device shows a constant temperature below the water table except in the area of sand aquifers where there is a slight decrease in temperature. The profile is thus in close correlation with the lithologic log of the hole. (Bradbeer-NWWA)

ELECTROMAGNETIC DEPTH SOUNDING FOR GROUND WATER EXPLORATION IN RESISTIVE FORMATIONS,
Indian Inst. of Tech., Kharagpur. Dept. of Geology and Geophysics.
H. P. Patra, and N. Sanyal.
In: International Symposium on Development of Ground Water, November 26-29, 1973, Madras, India, Vol 1, p Ib-I-9, 6 fig, 8 ref.

Descriptors: *Exploration, *Electromagnetics, *Remote sensing, *Surbsurface, *Conductivity, Locating, Surveys, Evaluation, Geophysics, Sounding.
Identifiers: *Electromagnetic depth sounding, *Resistive formations, *Groundwater exploration.

Failure of conventional direct current resistivity sounding in solving the problems of exploration of ground water resources in highly resistive formations, that is, in crystalline rocks and in loose, dry sands where a high contact resistivity almost stops direct current flow, makes multifrequency electromagnetic depth soudning techniques necessary. Dipole Frequency Sounding (DFS) is the method where the source is a horizontal, small, current-carrying dipole and the vertical component of the magentic field is measured at a fixed distance from the source by means of a pickup coil. Another method of sounding uses a comparatively larger loop and involves the measurement of the vertical component of the magentic field induced at the center of a circular or square loop. This is the Central Frequency Sounding (CFS) method. These two methods are compared in efficiency, depth of investigation and optimum frequency range. The applicability of the methods is demonstrated. A few representative master curves are reproduced and interpretation of field curves is discussed. (Bradbeer-NWWA)

A MATHEMATICAL APPROACH TO SOME ASPECTS OF GROUND WATER FLOW IN HARD ROCK AREAS,
Ground Water Inst., Poona (India).
D. G. Limaye, and S. D. Limaye.
In: International Symposium on Development of Ground Water Resources, November 26-29, 1973, Madras, India, Vol 2, p III-95-III-103, 5 fig, 2 ref.

Descriptors: *Base flow, *Aquifers, *Flow characteristics, *Flow rates, *Fluid movement, Wells, Dug wells, Water supply, Fracture permeability, Hydrology, *Groundwater movement, Mathematical models, Seasonal.
Identifiers: *Hard rock aquifers, Directional flow, India.

Field conditions in hard rock areas ofter deviate too far from those assumed for developing standard mathematical equations dealing with ground water flow towards wells in non-hard rock areas. Large drawdowns, limited aquifer dimensions, low permeabilities, large seasonal variations in well yield, non-radial flow and flow affected by structure are some of the peculiarities of hard rock areas in Central and Southern India. A basic approach towards formulation of a separate mathematical treatment for dug wells in hard rock areas is given on the basis of parallel flow lines. A basic equation of such flow is developed and its application to infiltration wells or galleries, and dug wells is shown. (Bradbeer-NWWA)

SKIMMING OF FRESH WATER AFLOAT UPON SALT WATER,
Pant Univ. of Agriculture and Technology, Pantnagar, Govind Ballabh (India).
B. M. Shani.
In: International Symposium on Development of Ground Water Resources, November 26-29, 1973, Madras, India, Vol 2, p IV-31-IV-42. 5 fig, 4 ref.

Descriptors: *Skimming, *Salt water aquifers, Saline water, Wells, Boreholes, Groundwater, Mathematical models, Computer models, Drawdown, Optimization, Saline water intrusion.
Identifiers: *Non-penetrating wells, *Skimming wells.

In many coastal areas as well as some inland aquifers fresh water is underlain by saline water. In such areas when fresh water is skimmed using a partially penetrating well, the reduced head towards the well causes an up coning of the fresh water-saline water interface beneath the well. In order to predict the maximum uncontaminated fresh water discharge, it is necessary to know the hydrodynamics of the up coning of the brine in response to pumping. Theoretical analysis as well as laboratory model studies were made to study this phenomenon. A mathematical model using, finite difference iterative technique is presented and developed for evaluating the performance of skimming wells under a wide range of field conditions. Practical utility of the results in deciding the optimum fresh water production from skimming wells is discussed. (Bradbeer-NWWA)

Tehran is situated on an alluvial plain immediately south of the Alborz Mountains which form an east-west chain stretching across northern Iran. The alluvium is composed of an older, folded group of probable Pliocene age, which is overlain by flat- lying Quaternary gravels, sands, silts, and boulder beds. Recharge from surface streams takes place in the areas underlain by the flat-lying alluvium. The pattern of ground water flow is related to the sub-surface structure of the alluvium. Chemical data are presented which indicate that

Identifiers: *Resistivity logging, *Matrix conduction.

Borehole resistivity methods have been used to study the Bunter Sandstone aquifer (Permo-Triassic) of north-west Lancashire, England. The results of water resistivity and normal logging surveys are discussed. Using the determined distribution of ground water resistivity an average formation factor is calculated for each well. This quantity is shown to be affected by conduction of the sandstone matrix, a phenomenon which is used to estimate hydraulic conductivity at borehole sites as follows. Within a limited section of the aquifer, values of hydraulic conductivity calculated from pump test data are correlated with formation factors corrected for several assumed levels of matrix conduction. The most significant correlation furnishes an empirical relationship which permits the interpolation of hydraulic conductivity in terms of the resistivity data. Estimated values of hydraulic conductivity at the sites of unlogged wells are generally at least as accurate as those obtained directly from interpolated hydrological parameters. The possible extension of the method to predict potential well yields is briefly indicated. (Bradbeer-NWWA)

PLANNING A MUST FOR GROUNDWATER DEVELOPMENT,
Baffa (John J.), Fort Lee, N.J.
J. J. Baffa.
Water and Wastes Engineering, Vol 12, No 2, p 44-50, February 1974. 3 fig.

Descriptors: *Water resources, *Planning, *Project planning, *Water management(Applied), Regional development, Ground water, Environmental effect.
Identifiers: *Environmental impact, *Groundwater development, Urban planning.

Design involves the provision of adequate quantity and quality for intended uses. Quantity available is related to aquifer extent, natural recharge characteristics, artificial recharge possibilities, drought occurrence and the properties of the aquifer which affect the extractability of the water in storage such as field permeability, transmissability and coefficient of storage. Quality is related to the naturally occurring relationships of solubility and ion exchange of soil rock. Additionally, the recognition of various environmental impacts must be considered in the design of groundwater supplies and management of groundwater basins. Situations where no data exists as to geology or hydrology require the use of geophysical methods or bore holes or both to permit geological and hydrological mapping. Surface characteristics of the recharge area should be examined for the use of the land in this area affects the quality of the water running over it, or infiltrating it, and subsequently percolating through it. Some of the available tools have been boreholes for regional and local correlations, test wells for estimates of performance and quality, and pumping testing of individual wells and groups of wells to determine aquifer transmissability and storage characteristics. Identifiers: *Hard rock aquifers, Mysore, *India.

Data of pump tests carried out on almost 50 dug wells tapping (1) hard rocks comprising schists, phyllites, granites, gneisses, metavolcanics, quartzites and (2) alluvial fills made up of coarse granular materials were analysed to determine specific capacities by using Slichter's formula. The dug wells ranged in cross-sectional area from 3.6 to 119 square meters, the alluvial wells being smaller with cross-sectional area varying from 3.6 to 29.2 square meters. The specific capacities of hard rock wells ranged from 1.26 liters per minute in massive metavolcanics to 187.5 lpm/m in weathered gneiss and from 59 lpm/m to 874 lpm/m in alluvium. Graphical representation of specific capacities against cross-sectional areas shows that wells in hard rocks and alluvium fall in distinct and identifiable fields. The specific capacities of wells located in hard rocks are, however, less due to the smaller cross-sectional areas yield of bore wells in hard rocks has also analysed. (Bradbeer-NWWA)

VALIDITY OF SOIL-WATER SAMPLES COLLECTED WITH POROUS CERAMIC CUPS,
Forest Service (USDA) Cadillac, Mich. North Central Forest Experiment Station.
E. A. Hansen, and A. R. Harris.
Soil Science Society of America Proceedings, Vol 39, No 3, p 528-536, May-June 1975. 9 fig, 2 tab, 8 ref.

Descriptors: *Equipment, *Sampling, *Soil water, Pollutants, Nutrients, Phosphorus, Nitrates, Laboratory tests, On-site investigations, Water pollution, Soil contamination, Soil filters, *Pollutant identification, Water quality.
Identifiers: *Suction lysimeter, Soil water samples, Porous cups, Unsaturated zone.

Laboratory and field tests were made to determine if porous ceramic cups collect representative samples of nitrate and phosphate from soil water. Substantial bias and variability were found. Some of the sources of sample bias were soroption, leaching, diffusion, and screening of phosphate ions by the cup walls. Sample variability of nitrate ions was strongly influenced by sampler intake rate, plugging, sampler depth, and type of vacuum system (which simulated different sampler sizes). These factors affect timing of sample collection and, because nutrient concentration in soil water is continually changing, they in turn affect sample concentration. These factors produced as much as a 60% range in sample concentration from 8 samplers installed in a small uniform plot. Added to this variability is an unknown amount of bias representing the difference between the sample concentration and the average drainable soil-water concentration. The many factors affecting the sample concentration together with the demonstrated variability and unknown bias make interpretation of sampler data difficult. To reduce sample variability, samplers should be grouped by intake rate. Short sampling intervals, uniform sampler lengths, and the same initial vacuum should be used for all samplers. (Sims-ISWS)

CHEMICAL QUALITY OF WATER IN CONSERVATION AREA 2A AND ASSOCIATED CANALS,
Cental and Southern Florida Flood Control District, West Palm Beach. Resources Planning Dept.
P. J. Gleason.
Technical Publication No 74-1, February 1974. 147 p, 17 fig, 21 tab, 13 ref, 2 append.

Descriptors: *Water quality, *Chemical analysis, *Wildlife conservation, *Evaluation, *Water analysis, *Florida, Analytical techniques, Chemistry, Instrumentation, Canals, Surface drainage, Nutrients, Nitrates, Phosphates, Marshes, Surface waters, Testing, Water chemistry, Drawdown, Specific conductivity, Mineralogy.
Identifiers: Hillsboro Canal, North New River Canal, *Everglades Park, Supply canals.

During the period October 1972 to August 1973, a detailed examination of surface water quality within Conservation Area 2A and associated canals in southern Florida was carried out. The chemical quality of the Hillsboro Canal and the North New River Canal waters was not significantly different from the 1940's. It was found that the Everglades marsh had a purifying effect on the agricultural drainage discharged over the area. Nutrients decreased to levels below detection limits and alkalinity showed a slight reduction. The marsh exhibited no effect on chloride, sodium, and silica concentrations. Drawdown of the area between February and July 1973 had no determinable effect on the chemical composition of the water refilling the marsh. Tabulated results of the chemical analyses of samples collected in the area were presented. (Henley-ISWS)

ENVIRONMENTAL MONITORING: A NEW REQUIREMENT FOR THE MINING INDUSTRY,
D. Lush, and K. Schiefer.
Canadian Mining Journal, Vol 96, No 5, May 1975, p 52-54, 72. 3 fig, 2 ref.

Descriptors: *Mining, Surface water, Temperature, Biochemical oxygen demand, Conductivity, *Sampling, *Groundwater, Heavy metals, Hydrogen ion concentration, Canada, Toxicity, Plankton.
Identifiers: Mill liquid effluent, Substrate clogging, *Pollution control.

While the results of these investigations had indicated the tailings effluent contained some environmentally undesirable components, their low concentrations were demonstrated to be non-toxic to fish. In the lengthy litigation that followed, certain facts came to light. A detailed scientific investigation of the area found the cause for declining fish stocks was threefold: (1) siltation of riffle areas resulted in reduction of critical spawning habitat; (2) the accumulation of several chemical elements in the sediments to levels that were toxic to small insects which formed the food base for fish populations; and (3) the long-term, sublethal effect of a floatation agent used in ore processing had inhibited normal reproductive cycles in several fish species. The result was a gradual decline in fish stocks over the years, instead of a direct and obvious fish kill, but the end result was the same. Through chemical, toxicological and biological monitoring an overall evaluation of the environmental effects of waste water discharged from mine or ore processing sites can be obtained. (Campbell-NWWA)

DEVELOPMENT OF IMPROVED PROCEDURES FOR MEASUREMENT OF MILL EFFLUENT AND RECEIVING WATER COLOR,
National Council for Air and Stream Improvement, Gainesville, Fla. Southern Research Center.
W. L. Carpenter, and H. F. Berger.
In: Proceedings of the 28th Industrial Waste Conference, Purdue University, May 1-3, 1973, p 234-251. 4 fig, 29 ref, 9 tab.

Descriptors: *Pulp wastes, *Natural streams, *Color, *Colorimetry, Spectrophotometry, Analytical techniques, Water pollution sources, Wastes, Industrial wastes, Water analysis, Water pollution effects, Water properties, Physical properties, *Pollutant identification.

This report summarizes the findings of a series of investigations on the measurement of effluent and receiving water color. The investigations reported cover several specific subjects, including an interlaboratory comparison of color measurement procedures, a study of sample clarification procedures, and an evaluation on turbidity and color removal effect during clarification of receiving water samples low in color yet high in turbidity. The interlaboratory comparison concluded that spectrophotometric procedures were best suited for both mill effluent and receiving water color measurements. It established further that comparable color measurements could be obtained between laboratories, provide that certain precautions were taken, such as control of sample pH and clarity, use of optically matched absorption cells, and reliable color calibration standards. Filtration through a 0.8-micrometer porosity membrane filter produced sample clarification equivalent to that accomplished by centrifugation or diatomaceous earth filtration, without removing any significant amount of true color. The effect of light path length on measured color is considered. Finally, a spectrophotometric procedure is proposed for routine measurement of true color in pulp and paper mill effluents and receiving waters. (Witt-IPC)

LIBRARY U. OF I. URBANA, ILLINOIS

COLOR OF PULP MILL EFFLUENTS.
Canadian Pulp and Paper Association, Technical Section, Standard H.5P, 3 p, September, 1974. 4 ref.

Descriptors: *Pulp wastes, *Color, *Water analysis, Spectrophotometry, Water pollution sources, Wastes, Industrial wastes, Analytical techniques, Colorimetry, Water properties, Physical properties, *Pollutant identification.

The Canadian standard method of measuring color can be applied to kraft and sulfite pulp mill effluents, provided their hues closely match the hue of a standard platinum- cobalt solution. Highly colored effluents are diluted volumetrically to bring their color into the range of the method. The effluent or diluted effluent is then adjusted to pH 7.6, prefiltered through a fiberglass paper, and filtered through a membrane filter having a nominal pore size of 0.8 micrometer. The pH is then readjusted to 7.6, if necessary, and the absorbance is measured in a spectrophotometer at a wavelength of 465 nm. The measured absorbance is then related to the absorbance of the platinum- cobalt standard solution at the same wavelength. (Witt-IPC)

POLAROGRAPHIC DETERMINATION OF DIMETHYL DISULFIDE AND METHYL MERCAPTAN IN AQUEOUS SOLUTIONS CONTAINING BOTH (OPREDELENIE METILMERKAPTANA I DIMETILDISUL'FIDA V VODNYKH RASTVORAKH PRI IKH SOVMESTNOM PRISTUSTVII POLYAROGRAFICHESKIM METODOM),
Arkhangelskii Lesotekhnicheskii Institut (USSR).
O. F. Gorbunova, and B. D. Bogomolov.
Izvestiya V.U.Z., Lesnoi Zhurnal, Vol 18, No 1, p 135-139, 1975. 2 fig, 5 ref, 1 tab.

Descriptors: *Pollutant identification, *Polarographic analysis, *Pulp wastes, *Sulfur compounds, Water pollution sources, Wastes, Analytical techniques, Industrial wastes, Organic compounds, Chemical analysis, Effluents.
Identifiers: *Dimethyl disulfide, *Methyl mercaptan, *Kraft mills.

The method described, which is suitable for the determination of the two sulfur compounds in kraft mill effluents, is based on the specific reaction of methyl mercuric iodide with thiol groups, which gives a reproducible polarographic wave at -0.55 to -0.6 volts. The electrolyte solution used has a pH of 9 and contains ammonia, ammonium chloride, pottassium chloride, and sodium sulfite. The last compound converts dimethyl disulfide into thiol compounds, and the result gives the total content of methyl mercaptan plus dimethyl disulfide. In a second sample, methyl mercaptan is oxidized with iodine in an acidic medium, the excess iodine is removed with sodium sulfite, and the polarographic determination is conducted as above. This gives one-half the amount of mercaptan and the total amount of disulfide. The amount of mercaptan is calculated as the double difference between the result of the first and second determinations. The amound of dimethyl disulfide is given as the difference between the total sulfur compounds and the amount of mercaptan. Results of analyses of a laboratory-prepared mixture of the two sulfur compounds are tabulated. (Stapinski-IPC)

Kimiya Drevesiny, No 2, p 105-111, March/April, 1975. 2 fig, 3 ref, 4 tab.

Descriptors: *Pulp wastes, *Phenols, *Water pollution sources, Gas chromatography, Organic compounds, Analytical techniques, Wastes, Industrial wastes, *Pollutant identification, Separation techniques, Aromatic compounds, Chemicals, Pulp and paper industry, Foreign countries, Water analysis.
Identifiers: Black liquor, Guaiacol, Baikal pulp mill(USSR), Lake Baikal(USSR), Kraft mill.

Block diagrams are given of two schemes for the separation of phenols from kraft black liquors of the Baikal pulp mill. The organic compounds in black liquor contain up to 5% phenols, including 15 different phenolic compounds. The principal phenol in the mixture was guaiacol (55-60%). The amount of phenol, itself, in the black liquor did not exceed 0.5%. A temperature-programmed gas-liquid chromatographic method was developed for the quantitative and qualitative analysis of total phenols. The analysis of monohydric phenols has a precision of 7%, while that of polyhydric phenols is 17%. The phenolic compositions of effluents from soda pulping and the evaporators are identical to that of black liquor. The principal source of pollution of mill effluents with phenols are the condensates of the black liquor evaporators and the pulping units. About 93% of the phenols are removed from pulp mill effluents. There was no phenol in the effluents being discharged into Lake Baikal. (Chern-IPC)

THE DETERMINATION OF SPECIFIC FORMS OF ALUMINUM IN NATURAL WATERS,
Geological Survey, Menlo Park, Calif.
R. B. Barnes.
Chemical Geology, Vol 15, p 177-191, 1975. 3 tab, 18 ref.

Descriptors: *Chemical analysis, *Aluminum, *Groundwater, *Testing procedures, Sampling, Chemical reactions, Ionization, Colloids, Suspended solids, Thermal springs, Oil wells, Filtration, Separation techniques, Methodology, *Pollutant identification.
Identifiers: Natural groundwaters.

A Procedure for analysis and pretreatment of natural-water samples to determine very low concentrations of Al is described which distinguishes the rapidly reacting equilibrium species from the metastable or slowly reacting macro ions and colloidal suspended material. Aluminum is complexed with 8-hydroxyquinoline (Oxine), pH is adjusted to 8.3 to minimize interferences, and the aluminum oxinate is extracted with methyl isobutyl ketone (MIBK) prior to analysis by atomic absorption. To determine equilibrium species only, the contact time between sample and 8-hydroxyquinoline is minimized. The Al may be extracted at the sample site with a minimum of equipment and the MIBK extract stored for several weeks prior to atomic absorption analysis. Data obtained from analyses of 39 natural groundwater samples indicate that filtration through a 0.1 micrometer pore size filter is not an adequate means of removing all insoluble and metastable Al species present, and extraction of Al immediately after collection is necessary if only dissolved and readily reactive species are to be determined. An average of 63% of the Al present in natural waters that had been filtered through 0.1 micrometer pore size filters was in the form of monomeric ions. The total Al concentration, which includes all forms that passed through a 0.1 micrometer pore size filter, ranged 2-70 micrograms/liter. The concentration of Al in the form of monomeric ions ranged from below detection to 57 micrograms/liter. Most of the natural water samples were collected from thermal springs and oil wells. APPLICATION OF GAS CHROMATOGRAPHY OF VOLATILE METAL CHELATES TO WATER ANALYSIS,
Illinois Inst. of Tech., Chicago. Dept. of Environmental Engineering.
R. A. Minear, and C. M. Palesh.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 39-61. 8 fig, 43 ref, 7 tab.

Descriptors: *Water analysis, *Gas chromatography, *Metals, Analytical techniques, Copper, Aluminum, Chromium, Beryllium, Iron, Lead, Nickel, Zinc, Water pollution sources, Water chemistry, Chromatography, Chelation, *Pollutant identification.

The use of trifluoroacetylacetone for the analysis of Cu, Al, Cr, and Be has been demonstrated with respect to natural water analysis. Gas chromatographic analyses were conducted with a Varian Aerograph model 1740 gas chromatograph equipped with either a flame ionization detector or a tritium electron capture detector. Of several columns evaluated, 5% QF-1 on Varaport 30, and 15% Carbowax 20M on Chromosorb W provided separations that allowed determination of Cu, Cr, and Al but not Fe. The Carbowax 20M column provided excellent resolution of Cu from Cr but not Fe, Al, and Cu from one another. Al, Cu, and Cr were separated on QF-1. Preliminary studies with 2,2,6,6-tetramethylheptane-3,5-dione (dipivaloylmethane) involving Pb, Ni, Cu, and Cr showed promise only for Pb. (See also W76-00105) (Witt-ICP)

Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
W. L. Templeton, E. A. Sutton, R. M. Bean, R. C. Arnett, and J. W. Blaylock.
In: 1975 Conference on Prevention and Control of Oil Pollution; Proceedings, p 489-496, March 1975. 3 fig, 1 tab, 14 ref.

Descriptors: *Lakes, *Oil pollution, Limnology, Water quality, Environmental effects, Toxicity, Organic compounds, Primary productivity, Sediments, Fauna, Wastes, Bioassay, Fisheries, Biodegradation, Sedimentation, Water pollution effects, Pollutant identification.
Identifiers: *Lake Maracaibo(Venezuela), Volatilization.

The results of a 2-year study on the impact of oil discharges, domestic wastes, and industrial pollution on Lake Maracaibo, Venezuela, were discussed. Analyses of environmental samples-water, sediments, and biota showed low concentrations of oil in lake water an no detectable accumulation of petroleum-derived hydrocarbons in muscle tissue of selected commercial species. The occurrence of bituminous materials in the sediments suggested that the natural processes of volatilization, biodegradation and sedimentation were the major mechanisms for the removal of oil from the surface waters. The lake system was described with relevant water quality, hydrographic, ecological, and fishery resources data. (Katz)

Identifiers: Tissue analysis, Bioaccumulation, Trawl samples.

Extensive chemical and biological studies were undertaken during and following a 65,000 barrel crude oil spill to determine the fate of discharged oil and to determine the adverse effects of the oil in the marine environment. 2,000 barrels of chemical dispersants were sprayed. Hydrocarbon determinations were made of the water column, sediments, and tissue samples. Benthic organisms were enumerated and identified. Trawl samples were taken of fish, shrimp, and crab, and bioassays were made. Results were discussed. (Katz)

DEVELOPMENT OF A RAPID AND SIMPLE TEST FOR BACTERIOLOGICAL WATER QUALITY UTLIZING LIMULUS LYSATE,
Montana State Univ., Bozeman. Dept. of Microbiology.
T. M. Evans, and D. G. Stuart.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-245 766, $5.25 in paper copy, $2.25 in microfiche. Research Report No 69, Montana University Joint Water Resources Research Center, Bozeman, September 1975. 102 p, 19 fig, 14 tab, 107 ref. OWRT A-080-MONT (1).

Descriptors: Water quality, *Water analysis, *Spectrophotometry, Microbiology, Assay, *Bioassay, *Bioindicators, Califorms, Bacteria, Enteric bacteria, *Pollutant identification, Pathogenic bacteria.
Identifiers: *Endotoxin, Limulus lysate assay, *Bacterial indicators.

The Limulus lysate assay (LLA) was used to measure the endotoxin content in stream water and was found to reflect the degree of bacterial contamination as measured by coliform, enteric, gram-negative and heterotrophic bacteria. On the basis of high positive correlations between bound endotoxin and coliform, enteric, gram-negative and heterotrophic bacteria, the measurement of bound endotoxin by the Limulus lysate assay was proposed as a rapid and sensitive test of bacterial water quality. Because of the assumptions that are inherent in using the LLA as a measure of bacterial water quality, more research is needed before the LLA can be generally applied. (Holje - Montana State)

STRATEGIES FOR WATER QUALITY MONITORING,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
J. K. Sherwani, and D. H. Moreau.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-245 765, $5.75 in paper copy, $2.25 in microfiche. North Carolina Water Resources Research Institute, Raleigh, UNC-WRRI Report No 107, June 1975. 137 p, 7 fig, 45 tab, 39 ref, append. OWRT A-065-0NC (2) 14-31-0001-4033.

Descriptors: *Monitoring, *Networks, *Network design, Sampling, Design standards, Data collections, Water quality, Water data, Design criteria, Mathematical models, *Water quality standards, Stations, *North Carolina, Pollutant identification, Regulation.
Identifiers: *Monitoring strategies, Monitoring networks, *Water quality monitoring, Sampling frequency, Water quality data, Stream standards.

General guidelines are provided for the preliminary design of a water quality monitoring system. The design is defined as the specification of the parameters to be determined, the number and location of sampling stations, and the frequency of sampling. The role of several objectives in the determination of monitoring strategy is considered. The objectives are the characterization of stream water quality, enforcement of stream standards and the detection of long-term trends. Principal component analysis is used to identify important water quality parameters and to find the appropriate size of a monitoring network. Information content defined as the reciprocal of the variance of the estimate of the mean concentration is suggested as a valid criterion for the design of a monitoring network for the characterization of water quality. Impact index based on the probability, severity and frequency of violation, number of direct users of the stream water, predominant use and the size of stream is proposed for determining the priority of location in an enforcement network. A protocol for the sampling of non-print sources is presented. The Research Triangle area in North Carolina is used as a case study. A possible framework for the strategy of water quality monitoring is described. This consists of an initial one-time baseline data collection program and eventually three types of networks: (a) an extensive network at relatively large number of key points, (b) an intensive network in selected drainage subbasins, and (c) a regulation network. TOXIC HEAVY METALS IN GROUNDWATER OF A PORTION OF THE FRONT RANGE MINERAL BELT,
Colorado School of Mines, Golden. Dept. of Chemistry.
K. W. Edwards, and R. W. Klusman.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-246 039, $3.75 in paper copy, $2.25 in microfiche. Colorado Environmental Resource Center, Fort Collins, Completion Report Series No 67, June 1975. 33 p, 5 fig, 6 tab, 18 ref. OWRT A-023-Colo(1).

Descriptors: *Trace elements, Groundwater, Potable water, Pollution *Colorado, *Gas chromatography, *Heavy metals, Toxicity, *Pollutant identification, Water analysis, Copper, Lead, Manganese, Mercury, Analytical techniques.
Identifiers: *Anodic stripping voltammetry, Front Range Mineral Belt(Colo), Arsenic, Selenium, Antimony.

Anodic stripping voltammetry and gas chromatography have been investigated with respect to their suitability for multielement analyses of trace elements in natural waters. The elements of interest in this study of toxic and esthetically undesirable elements in the regional ground waters of the Front Range Mineral Belt are arsenic, cadmium, copper, iron, lead, manganese, mercury, selenium, silver, and zinc. Atomic absorptions spectrophotometry is commonly used for analysis of these elements but permits only one element to be determined at a time. Anodic stripping voltammetry was highly sensitive and suitable for determination of low concentrations of cadmium, copper, lead, manganese, and mercury. For most of these elements the reproducibility was excellent at the ppb concentration level. Compared with direct flame atomic absorption, this method was more sensitive but not significantly faster despite determination of several elements per analysis. Gas chromatography was investigated for analysis of arsenic, antimony, and selenium by generation and separation of their hydrides. The method was difficult to use effectively and not sufficiently sensitive for natural water anslysis.

COMPUTER MODEL GUIDES SALT WATER WELL CONSTRUCTION,
EBA Engineering Consultants Ltd. Edmonton (Alberta).
P. L. Hall.
Johnson Drillers Journal, Vol 47, No 1, p 1-2, January-February, 1975, 2 fig.

Descriptors: *Groundwater, *Water wells, *Pollution, Pollutant identification, *Computer models, Canada, Saline water intrusion, Data collections.
Identifiers: New Brunswick(Canada), Fish processing plants, Well spacing.

A computer model was designed to simulate salt water intrusion and the effects of both fresh and salt water wells on the movement of the salt water wedge. The study was conducted by the Provincial Municipal Engineering Division in New Brunswick, Canada to avert a serious shortage of fresh water supplies to the fish-processing industry in the area. The computer model showed that it was practical to construct salt water wells that would satisfy these conditions: (1) the salt water wells should not cause contamination of existing wells, (2) the salt water wells should control the extent of salt water intrusion, and (3) the salt water wells should decrease the flow of fresh ground water to the seas and thus provide a fresh water supply for a considerable period of time. The wells were placed in production before the end of 1973 and the salt water movement has been monitored and compared with the predicted movement. Results of the computer model have been of considerable value. (Campbell-NWWA)

LEAD, ZINC, AND COPPER IN SOILS OF URBAN STORM-RUNOFF RETENTION BASINS,
Agricultural Research Service, Fresno, Calif. Water Management Research.
H. I. Nightingale.
Journal of the American Water Works Association, Vol 67, No 8, p 443-446, August 1975. 3 fig, 4 tab, 13 ref.

Descriptors: *Surface runoff, *Urban runoff, Retention, *Lead, *Zinc, *Copper, *Drainage systems, *California, Heavy metals, Storm drains, Pollutants, Public health, Water pollution sources, Urban drainage, Watersheds(Basins), Drainage effects, Soil chemical properties, Flood control, Gasoline, Flooding, Soil contamination, Groundwater recharge, Flood control, Bermudagrass, Soil analysis, Recreation.
Identifiers: *Storm-runoff retention basins, *Fresno(Calif), Urban flooding, Leaded gasoline, Environmental health problems, Retention basins.

A study was made to determine the amounts of three metal contaminants found in the soils of urban storm-runoff retention basins. Soil samples were taken at various depths in the basins and analyzed for copper, lead, and zinc. Utilization of storm-drainage retention basins to control urban flooding is a water-management system that tends to concentrate street-surface contaminates into a small area. Results of the soil analyses were shown. (Henley-ISWS)

C. R. Ganz, J. Schulze, P. S. Stensby, F. L. Lyman, and K. Macek.
Environmental Science and Technology, Vol 9, No 8, p 738-744, August, 1975. 5 fig, 4 tab, 20 ref.

Descriptors: *Organic compounds, Fish, Path of pollutants, Toxicity, Sampling, Analytical techniques, Water pollution effects, *Pollutant identification.
Identifiers: *Bluegill, Lepomis macrochirus, Tissue analysis, Bioaccumulation, FWA, *Fluorescent whitening agents, DASC-3, DASC-4, BSB, NTS-1, Flowthrough water systems.

Bluegill, Lepomis macrochirus, were exposed in dynamic flow through tank water systems to each of four sulfonated stilbene fluorescent whitening agents, (FWAs), DASC-3, DASC-4, BSB, and NTS-1, to determine to what degree these products accumulte in portions of the fish which may be consumed by humans. Only NTS-1 yielded tissue levels above those present in the tank water. FWA was completely eliminated from exposed fish within 14 days of their transfer to clean water. It was concluded that the compounds tested were likely to present little risk of accumulating and persisting in natural fish populations. (Klein)

EVALUATION OF SOME METHODS OF ANALYSIS FOR PETROLEUM HYDROCARBONS IN MARINE ORGANISMS,
Woods Hole Oceanographic Institution, Mass. Dept. of Chemistry.
J. W. Farrington, and G. C. Medeiros.
In: 1975 Conference on Prevention and Control of Oil Pollution;Proceedings, American Petroleum Institute, EPA and U.S. Coast Guard, March 1975, p 115-121, 4 fig, 3 tab, 27 ref.

Descriptors: *Clams, *Molluscs, Methodology, *Analytical techniques, *Chemical analysis, *Organic compounds, *Oil pollution, Evluation, Sampling, Gas chromatography, Marine animals, Water analysis, Bioindicators, Laboratory tests, *Pollutant identification.
Identifiers: *Virtis, *Soxhlet, Digestion methods, Bioaccumulation, Tissue analysis, Marcenaria mercenaria.

Soxhlet extraction, homogenization with Na2SO4 in a Virtis homogenizer, and KOH-methanol digestion methods of extracting hydrocarbons from marine organisms have been tested and compared using subsamples of a clam (Marcenaria mercenaria) homogenate. The amounts of hydrocarbons were determined gravimetrically and the composition was partially characterized by gas chromatography. There was a statistically significant difference between the results of the Virtis vs. Soxhlet and Soxhlet vs. digestion methods. However, in practice the difference was small and would be apparent only if large numbers of replicate measurements were made. (Klein)

THE FATE OF SPILLED NAVY DISTILLATE FUEL,
Civil Engineering Lab. (Navy), Port Hueneme, Calif.
P. J. Hearst.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A002 256, $3.75 in paper copy, $2.25 in microfiche. September 1974. 31 p, 7 fig, 6 tab, 11 ref.

Descriptors: *Oil wastes, *Oil spills, *Sea water, *Fuels, *Gas chromatography, Analytical techniques, *Pollutant identification, Persistence, Laboratory tests, Weathering, Water pollution sources, Evaporation, *Path of pollutants.
Identifiers: *Distillate fuels.

Laboratory weathering studies of four Navy distillate fuels on salt water showed that in thick films (5mm) the major portions of the oils (75-90%) did not evaporate in one week. These fuels are therefore relatively persistant oils. The physical properties did not change markedly and the thick emulsions or mousse, obtained with Navy special fuel oil were not obtained with the distillate fuels. Very thin films (0.1mm) evaporated much more rapidly, leaving residues of about 5%, whereas Navy special fuel oil left residues of 65%. The weathering characteristics are related to the distillation range as shown by gas chromatographic comparisons. (Katz)

Descriptors: *Fish, *Organic compounds, *Chlorinated hydrocarbons, *Fish physiology, Laboratory tests, Fish eggs, *Polychlorinated biphenyls, Water pollution effects, *Pollutant identification.
Identifiers: *Flatfish, *Tissue analysis, Bioaccumulation, Liver, Muscle, *Bering Sea.

Materials used for the study of polychlorinated biphenyls (PCB) concentrations in the muscle, liver and egg of four species of flatfish were collected from 14 locations in the Eastern Bering Sea. Analysis proved that PCB concentrations in muscle ranged between 0.02-0.13 ppm with distinct differences within the same species dependent on the source location. PCB contents in liver samples ranged from 0.06-0.27 ppm, i.e. always higher than the muscle values, and egg PCB contents were 0.01-0.03 ppm, i.e. lower than muscle level. (Klein)

Kyoto Univ. (Japan). Dept. of Fisheries.
K. T. Vijayamadhavan, and T. Iwai.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 41, No 6, p 631-639, June 19... fig, 15 ref.

Descriptors: Fish, Metals, *Fish physiology, Mercury, Copper, Zinc, Lead, Path of pollutants, *Heavy metals, Water pollution effects, Pollutant identification.
Identifiers: *Goldfish, Carassius auratus, *Taste cells, *Tissue analysis, Bioaccumulation, *Histological effects, Taste buds.

The rate of metal permeation into taste cells of goldfish, Carassius auratus varied with metal type, the concentration of metallic ions in the medium, and the duration of exposure. Mercury permeated the fastest, followed by copper, zinc and lead. Mercury damaged not only the taste buds but the entire epithelial layers within 30 minutes. Lead affected mucous cells more than the taste buds. Two types of taste cells in the taste buds were evident during the early phase of exposure to copper, mercury and zinc. (Klein)

INSTRUMENTATION FOR MONITORING WATER QUALITY,
Water Pollution Research Lab., Stevenage (England).
R. Briggs.
Water Treatment and Examination, Vol 24, Part 1, p 23-45, 1975. 10 fig, 2 tab, 21 ref.

Descriptors: *Pollutant identification, *Instrumentation, *Monitoring, *Water quality, Sampling, Suspended solids, Heavy metals, Toxicity, Ammonia, Data collection.
Identifiers: Sensors, Land-based monitoring stations.

Methods and instrumentation for monitoring water quality currently used in Great Britain are reviewed. Required units and limits of accuracy for data from automatic water quality monitors are given for the parameters of temperature, dissolved oxygen, oxidized nitrogen, ammoniacal nitrogen, organic matter, suspended matter, conductivity, chloride, hardness, pH value, sunlight intensity, and dissolved carbon dioxide. In order to achieve consistency, standards must be set for sampling frequency and sampling position. Types of available land-based package water quality monitors are described and the field performance of selected land-based monitoring stations in the United Kingdom is analyzed. Telemetry networks for water quality monitoring and the connection between automatic and manual control schemes are discussed. Many optical devices have been developed to monitor suspended solids concentration in river waters and effluents, and such sensors are accurate as long as optical surfaces are kept clean and if enough frequent calibrations are carried out to correct for errors arising from variations in particle density and size distributions. Specific instrumentation for measuring organic pollution, monitoring heavy metal concentrations, measuring ammonia, and detecting toxicity of pollutants to aquatic life are presently being developed. MONITORING THE ENVIRONMENT,
Denver Research Inst., Colo.
C. F. Heins, F. D. Johnson, and E. C. Mangold.
Environmental Science and Technology, Vol 9, No 8, p 720-725, August, 1975.

Descriptors: *Monitoring, *Spectroscopy, *Satellites(Artificial), *Remote sensing, *Data processing, *Computer programs, Instrumentation, Environmental control, Automation, *Pollutant identification, Water pollution sources.
Identifiers: LANDSAT, GOES.

Four developments in environmental monitoring are examined. These are spectroscopy, satellite transmission of environmental data, remote sensing, and computerized data processing. Improvements in instrumentation and techniques have occurred in response to stringent environmental legislation. Spectroscopic instruments are used primarily for atmospheric monitoring. Satellites have been tested for the relay of collected data from remote, automatic collection systems. The earth resources satellite LANDSAT and a system of Data Collection Platforms (DCP's) are used to collect and transmit data in digital form from sensors. Another system, designed for hydrological, meteorological, and oceanogaphic data is made up of the Geostationary Operational Environmental Satellites (GOES), which are being used by both governmental agencies and industrial firms. Several remote sensors are also being developed, based on technologies of correlation spectrometry, infrared sensors, and LIDAR (light detection and ranging) systems. With the continued use of such sensing, data collection, and satellite transmittal devices, specialized computer programs for interpretation of data have become increasingly important. Software programs used to identify bodies of water, to trace the paths of storms, and to classify land usage through digital imagery are being developed to assimilate the quantities of information which may be obtained from these new methods of environmental measurement. TRACE ELEMENT COMPOSITION OF STREAM SEDIMENTS, AN INTEGRATING FACTOR FOR WATER QUALITY,
Arkansas Univ., Fayetteville. Water Resources Research Center.
K. F. Steele, H. C. MacDonald, G. H. Wagner, and W. S. Bowen.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-246 045, $6.25 in paper copy, $2.25 in microfiche. Publication No 31, 1975. 160 p, 62 fig, 29 tab, 26 ref, append. OWRT A-025-ARK (3).

Descriptors: *Trace elements, Suspended solids, Dissolved solids, Geology, *Bottom sediments, Mineralogy, Water quality, *Arkansas, Sampling, *Pollutant identification, Tributaries, *Sediment transport, *Path of pollutants, *Metals, Spectrometry, X-ray fluorescences, Iron oxides, Adsorption.
Identifiers: *Buffalo River(Ark).

Bottom sediments, suspended sediments, and water were sampled along 130 miles of the Buffalo River in northern Arkansas. The water and acid extracts of the suspended sediments and the minus 95 mesh fraction of the bottom sediments were analyzed by atomic absorption spectrometry. All samples were analyzed for Na, K, Mg, Ca, Zn, Cd, Cu, Pb, Fe, Co, Cr, Ni, and Mn. Selected bottom samples also were analyzed for As, Hg, and Zr. Zr was determined by x-ray fluorescence. Li and Sr were determined for selected water and suspended sediment samples. There is a general decrease downstream in Fe, Cu, Cr, Ni, Mn, Pb, K, and Na in the bottom sediments as the drainage area increases in carbonate rock and decreases in shale. Mg, Ca, Zn, and Cd increase in bottom sediments downstream. The values for the these elements in the water, especially the major elements, also correspond closely with the geology of the region. Tributaries are sites of abrupt rise and fall of metal values, within a few miles, from background to anomalously high values to background, especially tributaries draining Zn and Pb mineralized areas. The bottom sediments are mainly quartz and chert grains. These grains apparently are coated with hydrous iron oxide which acts as a sorbent for many of the elements and is a domi-

LIBRARY U. OF I. URBANA-CHAMPAIGN

nant transport mechanism for acid extractable Co, Cr, Ni, Cu, Mn, and K. Other acid extractable metals, particularly Mg, Ca, Zn, Cd, and Pb. are mostly in clastic grains. Graphic representation of the Langmuir equation for Mn is consistent with adsorption of Mn by iron in both bottom sediments and suspended sediments.

EVALUATION OF A RECREATIONAL LAKE REHABILITATION PROJECT,
Dakota State Coll., Madison.
C. L. Churchill, C. K. Brashier, and D. Limmer.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-246 083, $4.75 in paper copy, $2.25 in microfiche. South Dakota Water Resources Institute, Brookings, Completion Report, August 1975. 75 p, 13 fig, 20 tab, 19 ref, 2 append. OWRT B-028-SDAK (1). 14-01-0001-3936.

Descriptors: *Dredging, Shore protection, Lake shores, Lakes, Eutrophication, Biological communities, Nutrients, Sedimentation, Sediment yield, *South Dakota, *Phosphorus, *Diatons, *Cyanophyta, *Chlorophyta, Silts, Recreation, *Lake sediments, *Bottom sediments, Monitoring, *Pollutant identification, *Phosphates.
Identifiers: *Lake Herman(SD), Gabion silt traps, *Lake rehabilitation, Orthophosphates.

Lake Herman, a recreational, shallow, warm water prairie lake near Madison, South Dakota drains an extensively cultivated watershed and acts as a siltation basin for a chain of four lakes. The lake is more than half silted in and since 1968 various rehabilitation efforts have been made, including the construction of silt traps and lake dredging. Continuation of the monitoring of chemical levels and biological populations of green algae, blue-green algae and diatoms has revealed two major changes: (1) ortho phosphate and total phosphorus levels (which increased markedly with the beginning of dredging) have decreased since dredging has ceased, and (2) other parameters including conductivity, chloride, hardness, calcium, magnesium, potassium, and sodium have been gradually increasing since 1968. Lake bottom core samples show a pattern of decreasing levels of extractable and total phosphorus with depth. Silt deposit area cores, however, show no consistent variation of phosphorus with depth, and furthermore have significantly lower levels of extractable phosphorus than the upper portion of the lake cores. Measurement of the silt depth at forty sites in Lake Herman and comparison of these measurements with those taken at the same sites in 1967 have revealed that the silt volume of the lake has increased by 2,022 acre feet or 23.8% during the eight years from 1967 to 1975. BACTERIOLOGICAL WATER QUALITY METHODS FOR DETERMINING RUMINANT FECAL POLLUTION,
South Dakota State Univ., Brookings,. Dept. of Microbiology.
P. R. Middaugh.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-246 047, $4.75 in paper copy, $2.25 in microfiche. South Dakota Water Resources Institute, Brookings, Completion Report, June 1975. 56 p, 4 fig, 7 tab, 45 ref. OWRT A-037-SDAK (1). 14-31-0001-3542.

Descriptors: *Water pollution sources, *Farm wastes, *Pathogenic bacteria, Indicators, Bacteria, *Enteric bacteria, Bioindicator, Water quality, *Livestock wastes, Human diseases, *Microbiology, *Bioassay.
Identifiers: *Ruminant fecal pollution.

Studies have been completed on development of microbiological methods for detection of farm animal waste pollution of lake and river water. To differentiate ruminant fecal pollution from domestic sources, the fecal streptococcus, Streptococcus bovis, which is reported to be unique in ruminants, was detected by specific selective methods amd media. S. bovis cells are differentiated by their starch hydrolyzing ability. The method as developed utilizes a membrane filter, 0.45 micron porosity, to concentrate the S. bovis cells. In one method the membrane is placed on modified Kenner-Fecal Streptococcus agar in a 60 mm petri dish. An overlayer of 3 ml of 1% agar which contains 0.2% starch-dye complex, Remazol Brilliant Blue-R dye coupled to amylose starch, is placed on the membrane. The cells are incubated at 37C in a moist chamber with an atmosphere of 75% N2 and 25% CO2 gas for 24 to 48 hours. Visible clear zones develop around cells containing amylose or starch hydrolyzing ability. A further development uses commercial Pfizer Selective Enterococcus agar medium (modified to exclude esculin and with added 2, 3, 5 triphenyltetrazolium chloride to pigment the colonies red). In this method the membrane filter carrying the S. bovis cells is overlaid with 3 ml of the modified PSE agar to which was added 0.2% amylose-azure dye to indicate starch hydrolysis after anaerobic incubation. The method has been evaluated by tests on lakes and rivers. A small number of related streptococci also hydrolyze starch. These are typical S. faecalis cells which are biochemically differentiated, if necessary. (Wiersma-South Dakota State)

CHECK SAMPLING FOR MONITORING BACTERIOLOGICAL QUALITY.
Missouri State Div. of Health, Jefferson City. Bureau of Water Supply.
R. S. Miller.
Journal of the American Water Works Association, Vol 67, No 1, p 28-32, January, 1975. 8 tab.

Descriptors: *Monitoring, *Water quality control, *Water quality standards, *Data collections, Data transmissions, Maintenance, Measurement, Regulation, Operations, Water purification, Biological treatment, Biocontrol, Diseases, Government regulation, Government standards, State jurisdiction, *Missouri, *Pollutant identification, *Bacteria.
Identifiers: Check sampling.

The Division of Health, Missouri, requires that water samples of public supplies be submitted for testing on a routine basis. A minimum of four samples per month is required if the particular supply provides no treatment, and four samples per week if water is treated. Most large water supply plants maintain their own bacteriological laboratories and do not submit samples directly, but all water-testing results are sent to the Division of Health which also surveys laboratories for water testing approval. When a problem occurs in the distribution system, contamination is all too often the result of improper procedure in the collection and submission of samples. Two problems emerge: (1) the need for training to provide qualified operators who properly collect and submit samples for bacteriological analysis, and (2) the need to develop technology related to maintaining water quality in the distribution system through better cross-connection control programs and procedures for disinfection of water mains following breaks. Quality control could be improved if local or regional laboratories were available near small communities so that test results would be available quicker without the time delays necessitated by forwarding and returning sample containers to distant laboratories. Technological developments are also needed for more rapid and accurate monitoring to determine acceptable quality from a bacteriological standpoint. (Bradbeer-NWWA)

VIRUS PROBLEMS AND THEIR RELATION TO WATER SUPPLIES,
Environmental Protection Agency, Washington D.C. Div. of Water Supply.
J. H. McDermott.
Journal of the American Water Works Association, Vol 66, No 12, p 693-698, December, 1974 fig, 4 tab, 19 ref.

Descriptors: *Viruses, *Enteric, *Epidemics *Potable water, *Water supply, Diseases, Biocontrol, Microbiology, Epidemiology, Aquatic microorganisms, Animal wastes, *Water quality standards.
Identifiers: Hepatitus, Typhoid.

Two objectives of the federal drinking-water program have been to evaluate application of contemporary standards of good practice and to recommend appropriate remedies including priority areas for future research and development. Several studies using the 1962 Drinking Water Standards as the basis of performance evaluation have been conducted in recent years. They have shown that many citizens are not being provided with drinking water that meets contemporary standards. Unnecessary risks are being taken in the production and distribution of drinking water. Viruses are parasites. Consequently, their occurrence, growth, and transmission are depended upon the invasion of living cells. Many of the enteric viruses are actually or potentially waterborne. These viruses and the associated diseases are listed. Most of the enteric viruses in surface waters are probably the result of inadequately treated sewage. It has been estimated that only 10 percent of municipal wastes effluents are disinfected prior to discharges. Disease statistics must be viewed very critically. It is reasonable to assume that the reported cases represent only 10 percent of the actual number of cases. Further, many of these cases have not been attributed to a mode of transmission at all but are potentially waterborne. There is a need to determine if single virus particles are passing through water treatment plants, but there is an inadequacy in methods for sampling, detecting, identifying, and enumerating viruses in water samples. (Bradbeer-NWWA)

USE OF A BIOASSAY TEST IN EVALUATING THE TOXICITY OF DRILLING FLUID ADDITIVES ON GALVESTON BAY SHRIMP,
Milchem Inc., Houston, Tex.
B. G. Chesser, and W. H. McKenzie.
In: Conference on Environmental Aspects of Chemical Use in Well Drilling Operations, May 22-23, 1975, Houston, Texas, 19 p, 5 fig, 2 tab, 8 ref.

Descriptors: Pollution, *Neritic, *Shrimp, *Drilling fluid, *Additives, *Drilling, Estuaries, Lagoons, Commercial shellfish, *Toxicity, Lethal limit, *Bioassay, Toxins, Water pollution effects, Chromium, Sea water, Methods, Texas.
Identifiers: *Lignosulfate, Polyacrylate, Defoamer, Hemlock, Galveston Bay(Tex).

A bioassay test to determine the degree of toxicity of drilling fluid additives to shrimp is described. The method used is patterned after that given in the Standard Methods for the Examination of Water and Wastewater, 13th ed. prepared and published jointly by American Public Health Association, Water Pollution Control Federation and American Water Works Association. Methods of collecting, acclimatization and exposure as well as the test apparatus are described. The results of 96 hour salt water toxicity tests with several common drilling fluid additives are given. The test materials are modified hemlock bark extract, chrome treated lignosulfate, iron lignosulfate, non-water dispersable defoamer, low molecular weight polyacrylate, and cellulosic-calcium carbonate workover additive. The 50 percent toxicity level of brown or white shrimp is given for each of these. The study does not cover all drilling fluid additives but the procedure appears to be a reli

and meaningful approach to measuring the toxicity of most additives to shrimp. (Bradbeer-NWWA)

K. D. Schmidt.
Water Resources Bulletin, American Water Resources Association, Vol 11, No 3, p 514-525, June 1975. 4 fig, 9 ref.

Descriptors: *Sewerage, *Water pollution, *Seepage, *Tracers, California, Sewage effluents, Waste water(Pollution), Water pollution sources, Sewage systems, Pipelines, Water quality, Groundwater recharge, Chlorides, Water supply, Sewers, Sewage, Leakage.
Identifiers: Fresno(Cal), Fresno sewage treatment plant, San Joaquin Valley, Regional sewering, Leakage of raw sewage.

Sewage effluent is commonly disposed of on land in arid regions, and the majority usually recharges the groundwater. This study evaluated the effect of sewering programs on groundwater quality. Samples were taken near the Fresno sewage treatment plant with chloride content used for effluent tracing. Recharge effluent was traced for about 10 miles indicating probable large amounts of leakage of raw sewage into the groundwater between Fresno and the treatment plant. (Robinett-Arizona)

GROUND WATER CONTAMINATION IN INDIANA,
Geological Survey, Indianapolis, Ind. Water Resources Div.
D. G. Jordan.
Journal of the American Water Works Association, Vol 54, No 10, p 1213-1220, October, 1962. 5 fig.

Descriptors: Pollution, *Groundwater, *Pollutant identification, *Water pollution, Waste disposal, Land disposal, Oil industry, Phenols, Sulfates, Bacteria, *Saline water, Brines, *Indiana, Brine disposal.
Identifiers: Bacterial contamination, Oilfield brines, Evaporation pits, Sulfate, Chromite.

Ground water quality changes that indicate contamination have been observed in several places in Indiana. Most of the contamination is local, but regardless of type, extent, and severity, its cause can generally be traced to the action of man. Some of the types of contamination in the state and the cause and effect of specific types are described. Bacterial contamination by septic-tank effluent is a potential threat to ground water supplies in many cities and country areas of the state. Saline water of high chloride content is the largest single contaminant of fresh ground water in the state. Aquifers in the coal-mining areas of the state are being contaminated by infiltration of water con-

LIBRARY U. OF I. URBANA-CHAMPAIGN

taining high concentrations of sulfate. Four occurrences of chromate contamination have been reported in the state. Contamination by phenol is reported at a well field in Elkhart, Indiana. In many situations, many years must elapse after a source of contamination has been identified and eliminated before the ground water again becomes potable. Early recognition of such contamination is urged. Effective controls are also needed for surface and subsurface disposal of concentrated solid and liquid waste products. (Campbell-NWWA)
W76-00276

FERTILIZER APPLICATION RATES AND NITRATE CONCENTRATIONS IN ILLINOIS SURFACE WATERS,
Washington Univ., St. Louis, Mo. Center for the Biology of Natural Systems.
R. Klepper, R. Parker, B. Commoner, and G. Shearer.
Illinois Institute for Environmental Quality, Chicago, Document No 74-38, December 1974. 85 p, 6 fig, 25 tab, 32 ref.

Descriptors: *Water pollution sources, *Fertilizers, *Nitrates, *Illinois, Water pollution, Pollutants, Nutrients, Chemicals, Nitrogen compounds, Agriculture, Farm management, Corn(Field), Crops, Corn belt, Agricultural watersheds, Water quality, Streams, Surface waters.

In recent years, during the spring months, the concentrations of nitrate in certain Illinois rivers have approached and sometimes exceeded the acceptable limit established by public health agencies--10 parts per million (ppm) of nitrate-nitrogen. The issue has been raised as to what action, if any, should be taken to correct this situation. An analysis was made of the relationship between observed concentrations of nitrate in Illinois rivers and the rate of application of nitrogen fertilizer to Illinois farm- lands, and this analysis was used to determine what influence various limitations of the rate of nitrogen application might be expected to have on nitrate levels. It was concluded that the nitrate problem is not a statewide problem in Illinois given a 10 ppm nitrate-nitrogen standard. It is concentrated in east central Illinois and is less acute in west central and northern Illinois. There would appear to be no problem in southern Illinois streams. The difference from region to region in the distribution of nitrogen fertilizer application rates and the fraction of acreage planted to corn leads to differences between regions in the estimates of limits on the rate of application of fertilizer nitrogen to corn which would be required to reduce nitrate concentrations to given levels. (Sims-ISWS)
W76-00290

THE DEPOSITIONAL ENVIRONMENT OF ZINC, LEAD AND CADMIUM IN RESERVOIR SEDIMENTS,
Tulsa Univ., Okla. Dept. of Earth Sciences.
F. W. Pita, and N. J. Hyne.
Water Research, Vol 9, No 8, p 701-706, August 1975. 8 fig, 3 tab, 16 ref.

Descriptors: *Sediments, *Suspended load, *Cadmium, *Lead, *Zinc, *Reservoirs, *Oklahoma, Correlation analysis, Mining, Reservoir silting, Selectivity, Sinks, Regression analysis, Model studies, Trap effieiency, *Deposition(Sediments), *Heavy metals, Sedimentation, Pollutants, On-site investigations.
Identifiers: Fort Gibson Reservoir(Okla).

Despite low water retention dams and intervening reservoirs, reservoirs located down- stream from a lead-zinc mining and milling area were found to contain relatively higher concentration of zinc, lead, and cadmium than were found in reservoirs outside the area. The metals were found to be concentrated in reservoir bottom sediments relative to metals concentration in surrounding soils. High trap efficiencies of upstream reservoirs and retention dams seemingly assure that transportation of heavy metals into the affected reservoirs is by suspended and dissolved loads. Zinc and lead contents were closely correlated to depth of water, organic content, and percentage of clay-size sediments. Zinc is preferentially weathered and transported from its source relative to lead. A model was developed in which lead and zinc are transported by ionic and/or organo-metallic solution into reservoirs. Using the postulated model, estimates were made of the removal efficiency in Fort Gibson Reservoir. study results estimated an average removal of 0.3 parts per million zinc and 0.04 parts per million lead from waters passing through Fort Gibson Reservoir. (Harmeson-ISWS)

SURVEY OF GROUND-WATER PROTECTION METHODS FOR ILLINOIS LANDFILLS,
Illinois Environmental Protection Agency, Springfield, Div. State of Land Pollution Control.
T. P. Clark.
Ground Water, Vol 13, No 4, p 321-331, July-August 1975. 5 fig, 8 tab, 14 ref.

Descriptors: *Landfills, *Water quality, *Groundwater, *Water pollution, *Protection, *Illinois, Monitoring, Water pollution control, Aquifers, Leachate, Water table, Environmental engineering, Garbage dumps, Water quality control, Observation wells, Piezometers, Methodology, On-site investigations, Wastes, Solid wastes, Waste treatment, Linings.
Identifiers: *Site selection, Protection methods.

The experience in Illinois of development of a rational program for protection of ground and surface water from the indiscriminant disposal of solid wastes is summarized. Classes of solid waste sites recognized and their position in terms of the hydrogeologic environment were presented. Means of controlling landfill leachate, either by natural renovation in subsurface materials or by engineered collection and treatment were discussed. Examples were presented which illustrate the in-field implementation of protective systems and monitoring devices for groundwater in Illinois, which should be generally applicable to other areas of the country of similar geology and climate. EFFECT OF CESSPOOL DISCHARGE ON GROUND-WATER QUALITY ON LONG ISLAND, N.Y.,
Nassau County Health Dept. Mineola, N.Y. Environmental Conservation Programs.
S. O. Smith, and D. H. Myott.
Journal of the American Water Works Association, Vol 67, No 8, p 456-458, August 1975. 7 fig, 2 tab.

Descriptors: *Cesspools, *Infiltration, *Groundwater, *Groundwater recharge, *Nitrates, *New York, Percolating water, Aquifer management, Water quality, Recharge, Waste disposal, Detergents, Leaching, Sewers, Urban hydrology, Aquifers, Urbanization, Water pollution, Water supply.
Identifiers: *Long Island(NY).

Large amounts of household wastes, discharged through cesspools, have resulted in deterioration of groundwater quality on Long Island. Although nitrate pollution poses the greatest threat to the Island's water supplies, other constituents derived from cesspool leachings are increasing. Municipa sewering projects which have been undertaken a a solution were discussed. Water suppliers in th county have undertaken various steps to cope wit water quality deterioration, including blendin water from two or more wells to produce an ac ceptable drinking water, deepening existing well or abandoning and replacing unusable wells. Th long range solution undertken is an extensiv sewering project begun in 1949. Present plans ca for 80% of the population to be sewered by 199 but escalation of sewering costs have made the a complishment of this task difficult (Pricket ISWS)

THE CATASTROPHIC DRIFT OF STREAM INSECTS AFTER TREATMENTS WITH METHOXYCHLOR (1,1,1-TRICHLORO-2,2-BIS(P-METHOXYPHENYL) ETHANE),
Waterloo Univ. (Ontario). Dept. of Biology.
R. R. Wallace, and H. B. N. Hynes.
Environmental Pollution, Vol 8, No 4, p 255-268, June 1975. 10 fig, 4 tab, 22 ref.

Descriptors: *Insecticides, Insects, *Chlorinated hydrocarbon pesticides, Streams, *Insect control, Growth stages, Larvae, Toxicity, Mortality, Selectivity, Biomass, Sampling, Environmental effects, *Aquatic insects, Canada, Path of pollutants.
Identifiers: *Methoxychlor, *Insect drifts, Bioaccumulation, Trichoptera, Simuliidae, Plecoptera, Ephemeroptera.

The catastrophic drift of aquatic insects after two experimental treatments with methoxychlor for the control of larval Simuliidae was studied in streams in Quebec. The treatments were administered from ground-level and from aircraft. There was a copious drift of dead and dying insects after the treatments. In both streams, simuliid larvae comprised only a small portion of the total drift of insects, indicating that the chemicals were not selective for Simuliidae. Most of the drift occurred within 150 minutes of the beginning of the treatments. The pattern of drifting insects after the treatments was similar for both streams, the numbers of insects caught increased rapidly to a maximum value, and then tapered off. Spraying of the length of a stream was not recommended for commercial control operations. (Klein)

FATE OF TRACE METALS IN LOS ANGELES COUNTY WASTEWATER DISCHARGE,
Massachusetts Inst. of Tech. Cambridge, Dept. of Civil Engineering.
F. M. M. Morel, J. C. Westall, C. R. O'Melia, and J. J. Morgan.
Environmental Science and Technology, Vol 9, No 8, p 756-761, August, 1975. 4 fig, 2 tab, 14 ref.

Descriptors: *Path of pollutants, *Heavy metals, *Environmental effects, *Sewage disposal, *California, Sediments, Zinc, Mercury, Gold, Copper, Cadmium, Lead, Chromium, Iron, Nickel, Cobalt, Manganese, Outfall sewers, Waste disposal, Pollutant identification, Water pollution effects.
Identifiers: Trace metals, Ocean disposal, *Los Angeles County(Calif).

Possible long range and short range effects of disposal of sewage containing trace metals into the coastal environment were investigated in Los Angeles County, California. Concentrations of various metals in sediments adjacent to a major outfall system were analyzed from amounts of Zn, Hg, Ag, Cu, Cd, and Pb (found in very insoluble sulfide), Cr and Fe (found in oxide forms), and Ni, Co, and Mn (Which are relatively insoluble). The Los Angeles County area sewage is unusually reduced and metal-rich in nature, and probably a typical of most sewage discharged from marine outfalls. However, studies of oxidation and dilution of the sewage by seawater indicated that most metals were solubilized upon ocean disposal and were well dispersed. The question of whether nearby sediments are a mixture of naturally occurring sediments and sewage particulate was left unanswered. It was estimated that 0.5% to 1.0% of the sewage organics are deposited. Further research on the interactions of suspended particulate matter for a better understanding of the fate of metal pollutants in waste water is recommended. (Kramer-FIRL)

TRACE ELEMENTS IN CORN GROWN ON LONG-TERM SLUDGE DISPOSAL SITE,
National Environmental Research Center, Cincinnati, Ohio, Advanced Waste Treatment Research Lab.
M. B. Kirkham.
Environmental Science and Technology, Vol 9, No 8, p 765-768, August, 1975. 4 tab, 18 ref.

Descriptors: Trace elements, *Pollutant identification, Toxicity, Municipal wastes, Sludge disposal, Sewage disposal, Analytical techniques, Soil analysis, *Corn(Field), Ohio.
Identifiers: Trace metals, Land application, Dayton(Ohio).

Sludge has been applied to land both for disposal purposes and for use as a soil conditioner and fertilizer, and concern has been expressed as to long-term concentrations of trace elements present in the dewatered sewage. An investigation was made as to whether plants grown on these soils might accumulate trace metals in amounts toxic to man or animals eating the crop. Corn plants (Zez mays L.) grown on soil treated with municipal sludge for 35 years in Dayton, Ohio, at a rate of 28 metric tons of sludge/ha/yr; plants from a plot that had been saturated with supernatant from sludge-holding lagoons from 1968 to 1971; and plants grown in a control plot that had never received sludge, were compared for trace element concentration. Their grains were analyzed for Al, Cd, Cu, Fe, Mn, Ni, Pb, and Zn. Soil in each area was analyzed to the 36-inch depth for total and dilute acid extractable concentrations of the trace elements. It was found that total concentrations of the elements in the 0 to 12-inch depth of soil were increased by sludge additions by the following factors: Al, 1.1; Cd, 35; Cu, 16.5; Fe, 1.1; Mn, 1.2; Ni, 2; Pb, 16.5; and Zn, 13. However, although these large amounts of trace elements accumulated in the soil, they did not accumulate significantly in the grain of corn plants grown in the treated soil when compared to control plants. The roots of the plants did contain large amounts of the elements, and concentrations of Cd and Cu in the leaves were found to be higher than normal. (Kramer-FIRL)

RADIOCARBON AGES OF GROUND WATER AS A BASIS FOR THE DETERMINATION OF SAFE LIMITS OF AQUIFER EXPLOITATION,
Nova Univ., Fort Lauderdale, Fla. Life Science Center.
M. A. Tamers, J. J. Stipp, and R. Weiner.
Environmental Research, Vol 9, No 3, p 250-264, June, 1975. 4 fig, 2 tab, 18 ref.

Descriptors: *Aquifers, *Groundwater, *Water supply, *Potable water, *Radioactive dating, *Florida, Water demand, Deep wells, Rainfall, *Pollutant identification, *Water pollution sources, Water quality standards.

The population that can be rationally supported by a municipal aquifer is a function of groundwater renewal rates. Thus, the age of groundwater of the Biscayne aquifer in south Florida was determined using radiocarbon dating techniques. This method provides a safe way to measure the water supply available. Dissolved carbonates were the material for age determination, with limestone dilution corrections of the measured carbon 14 activities made by comparisons of the relative concentrations of bicarbonate and total carbonates. The annual amount of water extracted must not exceed the quantity of rainfall that infiltrates underground in unpolluted zones. It was found for this area that the Hialeah-Preston well fields near Miami are intensively exploited, but produce deep well water free of contamination. The waters presently extracted by the deep wells are below the shallower depths influenced by untreated sewage disposal. For Dade County, and particularly the area around Miami, it was strongly recommended that unless present water treatment methods are improved significantly, the population should not be allowed to double. Deep municipal wells which now extract water are too close to the contaminated zone to permit an increased amount of pumpage without endangering public health. (Kramer-FIRL)

RAIN RECORDINGS AS BASIS FOR THE DIMENSNIONING OF RIN RUNOFF SYSTEMS (REGENSCHREIBERAUFZEICHNUNGEN ALS GRUNDLAGE ZUR DIMENSIONIERUNG VON REGENWASSERABLEITUNGSALAGEN),
H. Bosold.
Wasserwirtschaft-Wassertechnik, Vol 25, No 5, p 176-178, 1975. 8 fig, 2 tab, 5 ref.

Descriptors: *Mathematical models, *Rainfall, Measurement, Monitoring, *Strom runoff, *Rainfall-runoff relationships.
Identifiers: Rain water yields, *East Germany.

Rain water yields in liters/second were calculated for the Leipzing and Halle-Kroellwitz areas, East Germany, on the basis of pluviometric recordings and were compared to the conventional Reinhold calculations. The recordings were used in such a manner that each individual rainfall was arranged with its average rain yield as a function of the number of the rainfall hours per year and the number of the rainfall events according to their intensity, regardless of intensity fluctuations. The rain yield duration and rain yield frequency curves obtained for the two monitoring stations showed

LIBRARY U. OF I. URBANA

very few differences, which implies their applicability to the entire Halle-Leipzig area. However, considerable differences in storm runoff may be found to occur between the local and Central European rain yields. (Nave-FIRL)

ANALYSIS OF NONPOINT-SOURCE POLLUTANTS IN THE MISSOURI BASIN REGION,
Midwest Research Inst., Kansas City, Mo.
A. D. McElroy, F. Y. Chiu, and A. Aleti.
Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-600/5-75-004, March, 1975. 163 p, 35 fig, 13 tab,4 append. PE 1BA030 16 AFN 03 68-01-1863.

Descriptors: *Water pollution sources, Path of pollutants, *Missouri River, Data collections, Data processing, *Land use, Water quality, *Regression analysis, Correlation analysis, Model studies, *Computer models.
Identifiers: *Non-point source pollution.

A study of nonurban, nonpoint sources of pollution in the Missouri Basin utilized a unique, computer-based data system. The Data Bank contains extensive information on land use, soil, climate, water quality, and other parameters in the Missouri Basin. The current study was concerned with the adequacy of the Data Bank relative to development of nonpoint pollution models. Evaluation of information in the Data Bank yielded detailed land use and water quality profiles in the basin. The results show that the Data Bank is a useful base to depict the basinwide relations between various land uses and water quality. Regression equations of these relationships were developed for individual subbasins as well as for the entire basin. The regression equations, and the accompanying statistical analysis of significance, indicated that the water quality parameters NO3, BOD, and turbidity correlate well with land use on a basinwide basis. Other parameters, namely phosphorus, dissolved oxygen, and dissolved solids, did not correlate well with land use. (EPA)

MOVEMENT OF TRACE METALS WITH PERCOLATING WATER,
Rhode Island Univ., Kingston. Dept. of Civil Engineering; and Rhode Island Univ., Kingston. Dept. of Ocean Engineering.
M. C. Wang, and V. A. Nacci.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-246 104, $3.75 in paper copy, $2.25 in microfiche. Completion Report, (1975). 38 p, 24 fig, 1 tab, 12 ref. OWRT A-052-RI (1). 14-31-0001-5040.

Descriptors: *Path of pollutants, *Cation exchange, Cation adsorption, Metals, Soils, Clay minerals, Groundwater, Ions, Water Pollution, Wells, Lysimeters, Trace elements, *Percolating water, *Soil texture, Adsorption, *Copper, *Lead, Percolation, Ion exchange.
Identifiers: *Trace metals, *Metal ions.

The major objective was to study the mechanism of movement of trace metals in soils with percolating water. The parameters that were considered to affect the metal ion movement in soil included: soil texture, type and content of clay mineral, metal ion, hydraulic conditions, temperature and acidity. Several native soils and commercial clays were used to study the soil-metal ion interaction and movement of metal ions through the soils was determined by using soil lysimeters. The adsorption ability of the soils proved to be related to such soil physical properties as percent of clay size and plasticity index and the chemical property cation exchange capacity. The adsorption of Cu++ was considerably faster than that of Pb++ for two native soils which corresponds to the results of laboratory adsorption tests and soil boundary hydraulic conditions.

GEOCHEMICAL AND SEDIMENTOLOGICAL ANALYSIS OF TYGART LAKE, WEST VIRGINIA,
West Virginia Univ., Morgantown, Dept. of Geology.
M. L. Collin.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-246 046, $3.75 in paper copy, $2.25 in microfiche. West Virginia Water Research Institute, Morgantown Information Report 7, 1975. 41 p, 17 fig, 34 ref.OWRT A-009-WVA(1).

Descriptors: *Clay minerals, *Bottom sediments, *Geochemistry, *Pollutants, *Reservoirs, *Acid mine water, *Sewage, Colloids, Lake sediments, Reservoir silting, Limnology, Cation exchange, Cation adsorption, Sediment-water interfaces, Acid Streams, Acidic water, *West Virginia, Lakes, Artificial lakes, Sediments, Pollution, Aquatic environment, Entrainment, Clays, *Lake sediments.
Identifiers: *Clay fixation, Sediment environment, Sediment profile, Chemical quality, Tygart Lake(WVa).

This study was directed toward obtaining a clearer understanding of the sediment environment of Tygart Lake, a U.S. Army Corps of Engineers reservoir. The reservoir water is acid. Turbulence and total solids were found to be low. The sediment contained clay in proportions varying from 4.1 to 18.3 percent of the total. All parameters of the sedimentary clay exhibited clear patterns of lateral change from the dam toward the Tygart Valley River inlet, and with depth from the sediment-water interface to the base of the sampled core. For loss on ignition, cation exchange capacity, clay content, and the cations of nitrogen, phosphorus, calcium, iron, and magnesium, a decrease in percentages or absolute amounts were detected laterally from the dam toward the Tygart Valley River inlet, an increase was observed with depth in the sediment profile. For silicon, aluminum, and potassium cations, the patterns were reversed, so that increases were noted laterally from the dam toward the river inlet, and decreases were marked with depth in the sediment profile. Kaolinite, illite, vermiculite and minot amounts of montmorillonite were present. Further year-round study of the geochemistry of several limnic basinal areas will be required to verify any general occurrence of patterns of pollutant accumulation within clay sediment.

MOVEMENT OF CHEMICAL CONTAMINANTS IN GROUND WATER,
Dames and Moore, Park Ridge, Ill.
D. O. Gregg, and K. G. Kennedy.
Conference on Environmental Aspects of Chemical Use in Well-Drilling Operations, May 21-23, 1975, Houston, Texas, 19 p. 6 fig, 1 tab, 8 ref.

Descriptors: Pollution, *Groundwater movement, *Chemical wastes, Movement, *Path of pollutants, Leaching, Percolation, Soil contamination, *Water pollution sources, Chemical precipitation, Sorption, Ion exchange, Wastes.
Identifiers: Chemical contaminants.

The movement and dilution of chemical contaminants in a ground-water system are mainly controlled by the physical processes of convection transport and dispersion, by the geochemical processes of ion exchange, sorption, precipitation, and, in some cases, radionuclide decay, and biological processes. The discussion of several case histories of contamination of ground water systems illustrates the effects of the variability of the system itself and the properties of the fluid on the movement and dilution of chemical contaminants. The amount of data needed to determine the origin and path of contaminants is very large. There are few easy ways to determine the vertical and lateral extent, the rate and direction of movement, and the dilution of ground water contamination in many systems. (Bradbeer-NWWA)
W76-00410

DEVELOPMENT OF A NITROGEN BALANCE IN A LABORATORY SOIL PROFILE WITH A HEAVY APPLICATION OF BEEF CATTLE WASTES,
Kansas State Univ., Manhattan. Dept. of Agricultural Engineering.
J. A. George.
MS Thesis, 1970. 136 p, 6 fig, 10 tab, 8 ref.

Descriptors: *Cattle, *Soil profiles, Feed lots, Denitrification, Sampling, Analyses, *Farm wastes, Nitrogen, Path of pollutants, Water pollution sources.
Identifiers: *Nitrogen balance.

The purpose was to study the nitrogen cycle as it occurs in a soil profile with a high loading rate of beef feedlot wastes. In order to study denitrification under as natural conditions as possible and in order to determine a total nitrogen balance, an apparatus which combined the total soil profile of a lysimeter, the closed gas collection system of an incubation apparatus and the soil solution sampling ability of a soil percolation apparatus was designed. The results of 13 test runs revealed few solid facts about denitrification. They did indicate that part of the apparatus had great potential and that other parts needed further development and experimentation. The gas measuring and analysis part of the unit did not produce usable data, but the water sampling system produced quite good data. The soil and manure analysis data indicated that a considerable loss of nitrogen from the soil column occurred. Less than 10 percent of the total nitrogen loss from the soil was leached out in the water samples, indicating that the drawing off of water samples removes a minimum of nitrogen from the scene of active transformations. Only about 2 percent of the total indicated nitrogen loss was leached out of the bottom of the 4 foot soil profile. (Cartmell-East Central Oklahoma State)

PRINCIPLES OF NUTRIENT CONTROL FOR AGRICULTURAL WASTEWATERS,
Cornell Univ., Ithaca, N.Y. Dept. of Agricultural Engineering.
R. C. Loehr.
Presented at Second National Symposium on Food Processing Wastes, Denver, Colorado, March 23-26, 1971, p 605-615. 13 ref.

Descriptors: *Nutrients, *Control, *Wastewater(Pollution), Agriculture, Water pollution sources, Recycling, Eutrophication, Nitrates, Separation techniques, Groundwater.
Identifiers: *Land disposal.

Control of nutrients in agricultural discharges will become important in the near future as the nation's water resource policies receive greater scrutiny. Better data is needed concerning nutrient concentrations being discharged and processes that can be utilized for their control. Then technical decisions and cost estimates can be made. Among pollutant sources of concern are fruit and vegetable processing wastes; meat, poultry, and

fish processing wastes, and animal manures. Pollution problems caused by nutrients in wastewater discharges include: (1) additional oxygen demand caused by reduced nitrogen compounds, (2) stimulation of aquatic plant growth caused by nitrogen, phosphorus, and other nutrients in wastewater, and (3) excess nitrates in groundwater as a result of wastes discharged on land. The two most feasible approaches for nutrient control are separation at the source, recovery, and recycle and land disposal. The success of recovery and recycle depends upon the use of the product; success of land disposal depends upon better knowledge of the land as a disposal media. (Merryman-East Central Oklahoma State)

HYDROLOGY AND CHARACTERISTICS OF FEEDLOT RUNOFF,
Agricultural Research Service, Lincoln, Nebr.
N. P. Swanson.
In: Control of Agriculture-related Pollution in the Great Plains, Seminar, Lincoln, Nebraska, July 24-25, 1972, p 71-80. 2 fig, 12 ref.

Descriptors: Hydrology, *Feed lots, *Agricultural runoff, *Soil profiles, Topography, Meteorology, Infiltration rates, Phosphorus, Ammonia, Watersheds(Basins), Climate, Runoff, *Nebraska, Farm wastes.

A potential hydrologic pollution problem of runoff from 51,000 acres of Great Plains' feedlots existed in January of 1971. Rate of delivery of such runoff to streams is related to topographic, meteorological, and hydraulic characteristics in the feedlot area. Study of the agricultural runoff in Nebraska yielded the following hydrologic generalizations: (1) infiltration of pollutants into the soil profile is insignificant or very slow once a manure pack is formed, (2) a local problem of underground water pollution exists, (3) one inch rainfall may be absorbed by the soil manure mixture without runoff, (4) solids losses may be less from a feedlot than from tilled bare soil but moderate rainfall increases initiate much higher solids loss and COD value per unit volume of runoff, (5) rainfall intensity and solids removal directly influence phosphorus removal, (6) ammonia-N and NH3-N contents decrease with continuing precipitation, (7) snowmelt runoff contains more solids than rainfall runoff, (8) following a rainfall, feedlot runoff will start sooner, last longer, contain many more times the P, NH4-N content, and require less time to reach the point of discharge than the discharge from adjacent croplands, and (9) ordinarily it is not necessary to design runoff control facilities for the maximum possible precipitation. The location of a feedlot within a watershed in relation to fish populations, livestock water sources, and similar resources is most important. (Battles-East Central Oklahoma State)
W76-00435

EUTROPHICATION IN THE GREAT PLAINS,
Oklahoma Cooperative Fishery Unit, Stillwater.
R. C. Summerfelt.
In: Control of Agriculture-related Pollution in the Great Plains, Seminar, Lincoln, Nebraska, July 24-25, 1972, p 97-118. 5 tab, 42 ref.

Descriptors: *Eutrophication, *Great Plains, *Water pollution sources, *Fertilizers, *Feed lots, Nutrients, Irrigation, Agricultural runoff, Effluent, Discharge(Water), Drying, Incineration, Fish kills, Waste disposal, Water pollution effects, Waste water treatment.
Identifiers: *Winterkills, Pit disposal, Land disposal.

In the Great Plains area of the United States, an increasing amount of fertilizer has been applied to croplands since 1950. Simultaneously, the percentage composition of nitrogen, phosphorus, and potassium in fertilizers has increased as has the method of irrigation, thus enriching the water systems and causing eutrophication and winterkills. Increased use of commercial fertilizer in this area between 1955 and 1969 has increased N, P, and K concentrations in water systems above the minimum critical level. Eutrophication and winterkills in the North Central States and nitrate nitrogen levels of 55 to 60 percent entering Decator Lake, Illinois originated from fertilizers. Runoff from feedlot production in Kansas accounted for 5 to 27 reported fish kills during 1964. This population could have been controlled by use of (1) direct pit disposal of solids, (2) aerobic decomposition followed by either land disposal or drying and incineration or (3) proper location of the feedlot. Environmental standards, public demand for cleanup, and national policy are all burdening the discharger to prove that the effluent is innocuous. State water quality standards require treatment and control of animal feedlot discharge, but advancements in prevention of eutrophication are dependent upon the extra costs involved. SEALING OF ANAEROBIC DAIRY WASTE LAGOONS IN SANDY, HIGH WATER TABLE SOILS,
Florida Univ., Gainesville. Dept. of Agricultural Engineering.
C. G. Osterberg.
MS Thesis, 1972, 75 p. 20 fig, 20 tab, 14 ref.

Descriptors: *Soils, *Florida, *Dairy industry, Waste water treatment, Sampling, Analysis, Seepage, Flow rates, Sands, Groundwater, Nutrients, Anaerobic conditions, Microbiology, Farm wastes.
Identifiers: *Sealing, *Anaerobic lagoons, Loading rates, Hydraulic head.

A study was done to investigate the physical and biological sealing mechanisms of anaerobic dairy wastewater ponded over a highly permeable Florida fine sand. The effects of hydraulic head, manure loading rate and inhibited microbial activity were studied. Graphic analysis showed that the column receiving manure experienced a rapid reduction of flow rate to approximately 45 percent of the initial flow for the low loading rate and to 12 percent of the initial flow for the higher loading rates. After 113 days of manure loading, flow rate returned to 50 percent of the initial value for the low loading rate and to 30 percent for the higher rates. Little effect of hydraulic head on flow rate could be detected in the 15 cm. to 60 cm. range studied. The ultimate degree of soil sealing appears to depend on manure loading rate, although further long term testing is needed to determine if the ultimate sealing is related to the rapid sealing trend observed after several days of manure loading. NPDES PERMIT SYSTEM AND GUIDELINES FOR MICHIGAN PRESENTED AT THE AGRICULTURAL WASTE CONFERENCE, MICHIGAN STATE UNIVERSITY,
Michigan Dept. of Natural Resources, Lansing. Bureau of Water Management.
T. L. Kamppinen.
In: Agricultural Waste Conference Emphasis-Animal Waste, Kellogg Center, Michigan State University, East Lansing, May 22-23, 1974. p 67-69.

Descriptors: *Permits, *Water pollution control, *Feedlots, *Confinement pens, Livestock, *Water Quality Act.
Identifiers: Waste discharge permits.

On October 18, 1972, Congress pass Act 92-500 known as the Federal Water Quality Act Amendments of 1972. This Act was passed over a presidential veto. Section 402 established the National Pollutant Discharge Elimination System Permit Program. The Act required all point source dischargers to obtain a NPDES Permit by not later than December, 1974. The guidelines defined the term feedlot as a confined animal or poultry growing operation where crop or forage growth or production is not sustained in the area of confinement. To be recognized as a feedlot, the feedlot must meet one of the following criteria: (a) 1000 slaughter steers and heifers, (b) 700 dairy cattle, (c) 2500 swine over 55 lbs., (d) 10,000 sheep, (e) 55,000 turkeys, (f) 100,000 laying hens or broilers, (g) operations with unlimited continuous flow watering system, or (h) 1000 animal units from a combination of cattle, swine, or sheep. Michigan's requirements for filing of permit applications are discussed. (Cartmell-East Central Oklahoma State)

CONCENTRATIONS AND CYCLES OF BACTERIAL INDICATORS IN FARM SURFACE RUNOFF,
S. H. Kunkle.
In: Relationship of Agriculture to Soil and Water Pollution, Cornell University Conference on Agricultural Waste Management, Rochester, New York, 1970, p 49-60, 7 fig, 2 tab, 27 ref.

Descriptors: *Water pollution, *Agricultural runoff, *Coliforms, *Farm wastes, Bioindicators, *Vermont.
Identifiers: *Bacterial indicators, Feces, Sleepers River watershed(Vt).

Adequate surveillance techniques for detecting animal waste contamination of streams are essen-

LIBRARY U. OF I. URBANA

tial if water pollution is to be avoided. This report describes initial results from a study of bacterial pollution indicators on the Sleepers River Watershed, Danville, Vermont. During periods of storm runoff from the water shed concentration of total and fecal coliforms rose drastically, with distribution of the values closely related to the hydrograph. Total coliform concentrations in runoff from the hayfield (unsubjected to farm animal wastes) were similar to concentration in runoff from the partially grazed 0.75 sq km watershed, making use of total coliform data of questionable value for pollution surveillance within the rural watershed. To the contrary, the fecal coliform densities were much greater in the partially grazed watershed's runoff than in the hayfield's. Evidently the more specific coliform group is a much better pollution indicator for the conditions of the study. The percentage of total coliforms that were fecal types were much higher in the watershed runoff than in the hayfield runoff. This study emphasizes that the hydrologic processes are of extreme importance in reference to use of indicator organisms. These hydrologic and physical relationships need to be well described if water quality inputs in streams are to be successfully modeled. (Cartmell-East Central Oklahoma State)

DUMPS: A POTENTIAL THREAT TO GROUND WATER SUPPLIES,
Environmental Protection Agency, Washington, D.C. Office of Solid Waste Management Programs.
B. Neddle, and G. Garland.
Water Well Journal, Vol 24, No 1, p 83-87, January, 1975. 2 fig, 1 tab, 10 ref.

Descriptors: *Waste disposal, *Landfills, *Waste dumps, *Solid wastes, *Water pollution sources, Land use, Planning, Sites.
Identifiers: Site selection, Land use planning.

The production of leachate is a complex process involving many variables. Leachate is formed when water percolating through solid waste flushes out compounds and other processes of decomposition. Rain falling over a disposal site will partially infiltrate and partially run off the surface. A portion of that water which infiltrates will be used to meet the demands for evaporation and the remainder will percolate down through the soil into the buried solid waste. Initially, the solid waste acts as a sponge and simply absorbs the water. However, with continued water addition, the waste eventually reaches the limit of its moisture retaining capacity. At this point, any further water entering the waste will cause an equal volume of leachate to leave the waste. The process is greatly accelerate at open dumps where soil cover is not provided, because run off is greatly reduced, thereby increasing infiltration and leachate production. Liquid waste disposal contributes to the water going through the system as well as waters from adjacent areas and ground water moving through the waste. (Bradbeer-NWWA)

5C. Effects Of Pollution

INFLUENCE OF EFFLUENTS OF SULFITE CELLULOSE FACTORY ON ALGAE IN CULTURES AND RECEIVING WATERS,
Jyvaskyla Univ. (Finland). Dept. of Biology.
V. Eloranta, and P. Eloranta.
Vatten, Vol 30, No 1, p 36-48, 1974. 14 fig, 22 ref, 2 tab.

Descriptors: *Sulfite liquors, *Algae, *Pulp wastes, *Water pollution effects, *Bleaching wastes, Wastes, Industrial wastes, Water pollution sources, Toxicity, Acidity, Foreign countries, Europe, Bioassay, Cultures, Phosphorus, Effluents, Phosphorus compounds.
Identifiers: Finland, Spent sulfite liquor, Sulfite pulp mills, Woodroom effluents.

A modified bioassay method was used to study the effect of effluents from the Mantta sulfite pulp mill of G. A. Serlachius Oy. (Finland) on the growth of pure cultures of Ankistrodesmus falcatus. The effluents were taken from the main lake outfalls discharging the wastes of the barking plant (whoodroom), pulp mill, and bleach plant; and from separate processes from the pulp mill (spent cooking liquor and wash water) and the bleach plant (chlorination and alkali stage effluents). The effluents with the highest toxic and inhibitory effects included the spent cooking liquor and wash water and effluents from the main discharge conduit. Their toxicity is probably due to their acidity and the growth-inhibiting effect is presumably attributable to sulfur compounds. The effluent from the main discharge conduit also had a growth-stimulating effect, especially at concentration of 5-10%, after the initial inhibition had ceased. Woodroom and bleach plant effluents had little deleterious effects on algal growth. Woodroom effluent promoted algal growth due to its high phosphorus content. At their highest concentrations, the effluents sharply decreased the number of species and the total biomass. (Witt-IPC)

RECIPIENT INVESTIGATION IN THE LAKE GLAFSFJORDEN,
G. Nylander.
Vatten, No 2, p 109-116, 1973. 3 fig, 3 tab.

Descriptors: *Lakes, *Water quality, *Pollution abatement, *Pulp wastes, Hydrogen ion concentration, Color, Chemical oxygen demand, Biochemical oxygen demand, Oxygen, Phosphorus, Fibers(Plant), Sulfite liquors, Water pollution sources, Industrial wastes, Dissolved oxygen, Water pollution effects, Cellulose.
Identifiers: *Lake Glafsfjorden(Sweden), Sulfite pulp mills.

A comparison of the water samplings performed in 1967 and 1971 showed that great improvements have occurred in Lake Glafsfjorden (Sweden) since the effluent from a sulfite pulp mill was stopped in 1969. Improvements in pH, color, COD, BOD oxygen, and phosphorus content in the water layer near the bottom are reported. Cellulose fibers have been almost totally eliminated, and the presence of chironomidae indicates an improvement of oxygen conditions near the bottom. (Buchanan-IPC)

NUTRIENT INPUTS TO A LAKE AND THEIR EFFECTS UPON WATER QUALITY,
Rensselaer Polytechnic Inst., Troy, N.Y. Fresh Water Inst.
D. B. Aulenbach, and N. L. Clesceri.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 11-38. 3 fig, 13 ref, 2 tab.

Descriptors: *Nutrients, *Lakes, *Water quality, Lake basins, Watersheds(Basins), Water, Precipitation(Atmospheric), Surface runoff, Groundwater, Shores, Water levels, Waste water(Pollution), Phosphorus, Nitrogen, Water quality standards, Water quality control, Water pollution sources, Human population, *New York.
Identifiers: *Lake George(New York)

The components of a lake system (water, basin, and watershed) and the manner in which each can affect the quality of water within a lake are described. Major and minor elements required to support biological life are identified and the contribution of nutrients to a lake by precipitation, surface runoff, groundwater, human development and activity, physical changes in the lake (e.g. water level, shoreline, dredging, and filling), and waste discharges are discussed. U.S. Environmental Protection Agency standards for phosphorus and nitrogen contents of lakes are reviewed, and the results of a study of the annual nitrogen and phosphorus sources and sinks in Lake George, New York, are presented and discussed. (See also W76-00102) (Witt-IPC)
W76-00104

A STUDY OF THE EFFECTS OF THE SAN FRANCISCO OIL SPILL ON MARINE LIFE PART II: RECRUITMENT,
College of Marin, Kentfield, Calif.
G. L. Chan.
In: 1975 Conference on Prevention and Control of Oil Pollution3 proceedings, p 457-461, March 1975. 9 fig, 6 ref.

Descriptors: *Oil spills, *Oil pollution, *Invertebrates, *Fuels, Crabs, Clams, Mussels, Sampling, Water pollution effects, Environmental effects, *California.
Identifiers: *Bunker C fuel, *Barnacles, Recolonization, Transects, Sea anemones, Balanus glandula, Chthamalus dalli, Pollicipes polymerus, *San Francisco Bay.

A study of marine organisms on intertidal transects was made to observe the effects of the San Francisco Bunker C oil spill of January 18, 1971. From a comparison of pre-oil and post-oil transect data, it was estimated that 4.2 to 7.5 million marine invertebrates, chiefly barnacles (Balanus glandula, Chthamalus dalli, and Pollicipes polymerus) were smothered by the oil. Other invertebrates included sea anemone, crabs, chiton, sea mussel and boring clam. In subsequent observations from 1972 to 1974, the sample counts of invertebrates had returned to, and in some cases surpassed pre-oil transect levels. No lingering effects of the oil spill were noted in any of the marine species. (Katz)
W76-00135

PRELIMINARY OBSERVATIONS ON THE MODE OF ACCUMULATION OF NO. 2 FUEL OIL BY THE SOFT SHELL CLAM, MYA ARENARIA,
Rutgers-The State Univ., Newark, N.J. Dept. of Zoology and Physiology.
D. M. Stainken.
In: 1975 Conference on Prevention and Control of Oil Pollution: Proceedings; p 463-468, March 1975. 3 fig, 3 tab, 36 ref.

Descriptors: *Mollusks, *Clams, *Oil pollution sources, *Animal physiology, *Fuels, Tracers, Laboratory tests, Path of pollutants, Analytic techniques, Environmental effects, Water pollution effects.
Identifiers: *Fuel oil (No2), Mya arenaria, Bioaccumulation, Tissue analysis.

Young Mya arenaria were exposed to 50ppm, 100ppm, and 150ppm concentrations of emulsified No 2 fuel oil and an oil soluble dye in seawater at 5 and 22 degrees C. The clams treat oil micelles as globules as food or detritus particles. The smaller

oil micelles were passed by direct ciliary currents o the stomach. Larger globules were bound by nucus secreted by the gill ctenidia. Gas chro- natography and mass spectro- metry confirmed he binding of oil-mucus. The oil-mucus was in- ested or rejected by means of the clam ciliary athways. Environmental implications were iscussed. (Katz)
W76-00136

ACCUMULATION, RELEASE, AND DISTRIBU- TION OF BENZO (A) PYRENE -C14 IN THE CLAM, RANGIA CUNEATA,
Texas A and M Univ., College Station. Dept. of Biology.
. M. Neff, and J. W. Anderson.
n: 1975 Conference of Prevention and Control of Oil Pollution:Proceedings, March 1975, p 469-471, tab, 15 ref.

Descriptors: *Mollusks, *Clams, *Animal physiology, *Oil pollution, *Organic compounds, Tracers, Analytical techniques, Laboratory tests, Toxicity, Path of pollutants, Environmental ef- ects, Water pollution effects.
Identifiers: Rangia cuneata, *Benzo (a) pyrene- C14, Bioaccumulation, Tissue analysis.

Groups of estuarine clams, Rangia cuneata, were xposed for 24 hours to synthetic seawater con- aining in solution 0.0305 ppm benzo (a) pyrene - C14. In two experimental exposures, average total oncentrations of benzo (a) pyrene (BAP) in the lam tissues were 7.2 ppm and 5.7 ppm, approxi- nately 200 times the ambient level. The majority f the radioactivity was localized in the viscera vhich contains the digestive system, gonads and eart. The other tissues analyzed, the mantle, gills, dductor muscle, and foot, each contained 3-16% f the radioactivity. Whe returned to isotope-free eawater, the clams immediately began to release he accumulated BAP. After 30 days only 0.07 ppm BAP remained in the tissues. BAP could not be de- ected (limits of detection, 0.01 ppm) in clams naintained in isotope-free seawater for 58 days. During depuration, the distribution of radioactivi- y in the tissues remained relatively constant. The iscera contained most of the activity at all sam- ling times. (Katz)

MORPHOLOGICAL ANOMALIES IN ADULT OYSTERS, SCALLOP, AND ATLANTIC SIL- VERSIDES EXPOSED TO WASTE MOTOR OIL,
Environmental Protection Agency, National Marine Water Quality Lab., West Kingston, R.I.
G. R. Gardner, P. P. Yevich, and P. F. Rogerson.
n: 1975 Conference on Prevention and Control of Oil Pollution; Proceedings, p 473-477, March 1975. fig, 1 tab, 15 ref.

Descriptors: *Oil pollution, Aquatic animals, Atlantic silversides, *Mollusks, Animal physiolo- y, *Oil wastes, Path of pollutants, Toxicity, En- ironmental effects, Chemical analysis, Lethal mit, *Oyster, Bioindicator.
dentifiers: *Scallops, *Waste motor oil, LC-50, Tissue analysis, Bioaccumulation, Menidia enidia, Aquipectins irradians, Crassostrea vir- inica.

Waste motor oil concentration of 20 ppm and igher induced lesions in the vascular systems of tlantic silversides, Menidia menidia, and oysters, Crassostrea virginica. The lesions were associated vith the pseudobranch, the heart, and the arterial ystem of the silversides, and the branchial ef- erent vein of the oyster. Lesions occurred in the astro-intestinal tract of the oyster, and gill and idney of scallop, Aquipectins irradians, and the antle of both species. The scallop demonstrated he highest sensitivity to the toxic effects for eriods up to 60 days. The highest sensitivity to he toxic effects for periods up to 60 days. The C-50 (96-hr) value for waste motor oil and adult tlantic silversides was 1,700 ppm. Acute toxicity values were not determined for the oyster or scal- lop. (Katz)
W76-00138

LONG-TERM CHEMICAL AND BIOLOGICAL EFFECTS OF A PERSISTENT OIL SPILL FOL- LOWING THE GROUNDING OF THE GENERAL M. C. MEIGS,
National Marine Fisheries Service, Seattle, Wash.
R. C. Clark, Jr., J. S. Finley, D. G. Patten, and E. E. DeNike.
In: 1975 Conference on Prevention and Control of Oil Pollution; Proceedings, p 479-487, March 1975. 8 fig, 4 tab, 6 ref.

Descriptors: *Oil spills, *Oil pollution, *Intertidal areas, Analytical techniques, Organic compounds, Path of pollutants, Environmental effects, Inver- tebrates, Algae, Aquatic plants, Crabs, Popula- tion, Persistence, *Washington, Water pollution effects.
Identifiers: Long-Term effects, Sea urchins, Recolonization, Anemones, Urchins, Bioaccumu- lation, *Cape flattery(Wash).

Petroleum hydrocarbon uptake patterns and ob- servations of plant and animal populations of an intertidal community exposed continually since January 1972 to small quantities of a Navy Special Fuel Oil residue from the grounded unmanned troopship General M. C. Meigs were obtained by an interagency team of oceanographers, biolo- gists, chemists and engineers. Although the tar- ball-like character of the released oil served to limit its coverage, specific members of the inter- tidal community showed effects of the persistence of the spill. Long-term observations and analyses made since the grounding of the 622-foot military transport on a rich and productive intertidal regime are described. (Katz)

THE EFFECT OF PRUDHOE BAY CRUDE OIL ON SURVIVAL AND GROWTH OF EGGS, ALEVINS, AND FRY OF PINK SALMON, ON- CORHYNCHUS GORBUSCHA,
National Marine Fisheries Service, Auke Bay, Alaska. Auke Bay Fisheries Lab.
S. D. Rice, D. A. Moles, and J. W. Short.
In: 1975 Conference on Prevention and Control of Oil Pollution:Proceedings, p 503-507, March 1975. 2 fig, 4 tab, 19 ref.

Descriptors: *Salmonids, *Pink salmon, *Toxicity, *Oil wastes, *Oil pollution, *Growth stages, *Resistance, Fish eggs, Fry, Freshwater, Saline water, Organic compounds, Laboratory tests, Water pollution effects, *Bioassay.
Identifiers: Oncorhynchus gorbuscha, *Prudhoe Bay Crude Oil, TLM, Alevins, Sublethal effects.

Standard 96-hour bioassays with 'total' oil solu- tions in freshwater and seawater determined dif- ferences in sensitivity of the developing life stages of pink salmon, Oncorhynchus gorbuscha. Eggs were the most resistant and emergent fry (yolk sac absorbed) the most sensitive to acute 4-day expo- sures. Susceptibility was greater in seawater after fry migration. (Katz)

EXPERIMENTAL CRUDE OIL SPILLS ON A SMALL SUBARCTIC LAKE IN THE MACKEN- ZIE VALLEY, N.W.T.: EFFECTS ON PHYTOPLANKTON, PERIPHYTON, AND AT- TACHED AQUATIC VEGETATION,
Toronto Univ., (Ontario). Dept. of Botany.
J. A. Hellebust, B. Hanna, R. G. Sheath, M. Gergis, and T. C. Hutchinson.
In: 1975 Conference on the Prevention and Con- trol of Oil Pollution:Proceedings, p 509-515, March 1975. 7 fig, 2 tab, 9 ref.

Descriptors: *Oil spills, *Oil pollution, *Limnology, *Lakes, *Phytoplankton, *Periphyton, *Vegetation, Environmental effects, Laboratory studies, On-site tests, Cyanophyta, Methodology, Biomass, Succession, Population, *Canada, Water pollution effects.
Identifiers: Experimental oil spills, Subarctic lakes, *Crude oil, *Macrophytes, Oscillatoria an- gustissima, Mackenzie Valley(NWT).

Experimental crude oil spills were made in 3-m2 cylinders in open water, and in submerged moss, horsetail, and sedge communities of a small sub- arctic lake in the Mackenzie Valley, near Norman Wells, N.W.T. Studies were made of the effects of crude oil on phytoplankton, periphyton, and at- tached macrophytes in terms of population com- position, seasonal succession, and biomass. The presence of crude oil (15 liters m-2) had no signifi- cant effects on phytoplankton composition or abundance throughout the growth season but had a marked inhibitory effect on most members of the periphyton. One notable exception to this observa- tion was a considerable growth stimulation of the blue-green alga Oscillatoria angustissima. (Katz)

PETROLEUM HYDROCARBONS AND OYSTER RESOURCES OF GALVESTON BAY, TEXAS,
Virginia Inst. of Marine Science, Gloucester Point.
R. D. Anderson.
In: 1975 Conference on Prevention and Control of Oil Pollution:Proceedings, p 541-548, March 1975. 2 fig, 5 tab, 30 ref.

Descriptors: *Organic compounds, *Oil wastes, *Oil pollution, *Oysters, Resistance, Toxicity, Animal physiology, Oil industry, Path of pollu- tants, Shellfish, Environmental effects, Analytical techniques, *Texas, Bays, Absorption, Water pol- lution effects.
Identifiers: *Tissue analysis, Crassostrea vir- ginica, Depuration, Sublethal effects, No. 2 fuel oil, Galveston Bay(Tex).

Field and laboratory studies of petroleum hydrocarbons in the tissues of the American oyster, Crassostrea virginica, were conducted from 1971 to 1974. Analysis of tissues revealed sig- nificant amounts of oil-derived petroleum hydrocarbons from oysters collected in areas near petrochemical industries. Lower values were found in meats from oysters collected at natural and artificial reefs. Uptake and depuration of petroleum hydrocarbons were determined. In oil- free seawater, oysters released saturated chains and most aromatic fractions rapidly with depura- tion to below detectable levels taking place within 52 days. (Katz)

FATE OF PETROLEUM HYDROCARBONS IN MARINE ZOOPLANKTON,
Skidaway Inst. of Oceanography, Savannah, Ga.
R. F. Lee.
In: 1975 Conference on Prevention and Control of Oil Pollution:Proceedings, p 549-553, March 1975. 1 fig, 9 tab, 17 ref.

Descriptors: *Oil wastes, *Oil pollution, *Zooplankton, *Copepods, Organic compounds, Animal physiology, Water quality, Jellyfish, Am- phipoda, Toxicity, Sampling, Tracers, *Absorption, *Metabolism.
Identifiers: Tissue analysis, Bioaccumulation, Euphausiids, Ctenophores, Crab zoea, 3H-benz- pyrene, 14C-benzpyrene, 3H-methylcholanthrene, 14C-napthaline, Chemical discharge.

LIBRARY U. OF I. URBANA

The uptake, metabolism, storage and discharge of petroleum hydrocarbons by marine zooplankton were discussed in light of the marine food web. Both paraffinic and polycyclic aromatic hydrocarbons were added to seawater containing various species of zooplankton - copepods, euphausiids, amphipods, crab zoea, ctenophores and jellyfish - collected off California, British Columbia and in the Arctic. Hydrocarbons found included 3H-benzpyrene, 14C-benzyprene, 3H-methylcholanthrene, and 14C-napthalene. (Katz)

LONG-TERM EFFECTS OF AN OIL SPILL AT WEST FALMOUTH, MASSACHUSETTS,
Marine Biological Lab., Woods Hole, Mass.
A. D. Michael, C. R. Van Raalte, and L. S. Brown.
In: 1975 Conference on Prevention and Control of Oil Pollution:Proceedings, p 573-582, March 1975. 19 fig, 16 tab, 8 ref.

Descriptors: *Oil pollution, *Oil spills, *Speciation, *Benthic fauna, Sediments, Succession, Fuels, Gas chromatography, Analytical techniques, Density, Distribution patterns, Environmental effects, Sampling, *Massachusetts, Pollutant identification, Water pollution effects.
Identifiers: Long-term effects, Opportunistic species, Hydrocarbon analysis, West Falmouth(Mass).

A small spill of No. 2 fuel oil occurred near Wild Harbor, Massachusetts, in September 1969. The benthic fauna of the Wild Harbor Marsh, boat basin, and offshore area was sampled through the fourth and fifth years after the spill (1973,1974). Sediment samples were analyzed for the presence of petroleum hydrocarbons. Gas chromatography produced evidence of hydrocarbons typical of weathered fuel oil in the sediments of the marsh, boat basin, and two offshore stations. The numbers of benthic species at the offshore stations and the marsh were slightly, but significantly, lower than those found at control stations. Population densities were similar to control areas for the offshore stations but not in the case of the marsh. The boat basin was still heavily affected. Some stations were characterized by the presence of opportunistic species. The recovery process in terms of the total benthos has leveled off, but there was evidence for further recovery during the course of the study. (Katz)
W76-00146

BOONE CREEK OIL SPILL,
Environmental Protection Agency, Edison, N.J. Surveillance and Analysis Div.
D. Schultz, and L. B. Tebo, Jr.
In: 1975 Conference on Prevention and Control of Oil Pollution:Proceedings, p 583-588, March 1975. 4 fig, 1 tab, 11 ref.

Descriptors: *Fuels, *Oil pollution, *Organic compounds, *Oil spills, *Invertebrates, *Periphyton, *Sediments, *Fish, Data collections, Sampling, Succession, Population, Environmental effects, Speciation, *South Carolina, Water pollution effects.
Identifiers: *Diesel fuel, Biological surveys, *Bone Creek(SC).

A biological survey was conducted on the effects of a 7,000 gallon diesel fuel spill into Boone Creek, South Carolina. Macroinvertebrate organisms, periphyton, and fish were collected, preserved, identified and enumerated. Sediments were analyzed for hydrocarbon content. Locations downstream from the oil spill contained reduced numbers and types of organisms. 90% of the fish community was killed during the initial oil spill. Periphyton growths, dominated by diatoms, increased at locations downstream during early summer. Analysis of substrate sediment samples revealed hydrocarbons still present in Boone Creek 13 months after the spill occurred. (Katz)
W76-00147

FATE AND EFFECTS OF CRUDE OIL ON AN ESTUARINE POND,
Gulf Coast Research Lab., Ocean Springs, Miss.
J. S. Lytle.
In: 1975 Conference on Prevention and Control of Oil Pollution:Proceedings, p 595-600, March 1975. 7 fig, 3 tab, 11 ref. EPA 68-01-0745.

Descriptors: *Ponds, *Limnology, *Estuaries, *Oil pollution, *Speciation, *Fish populations, *Plankton, Zooplankton, Phytoplanktons, Water quality, Sediments, Environmental effects, Fauna, Primary producers, Gas chromatography, Toxicity, Oil spills, Water pollution effects.
Identifiers: *Crude oil, Long-term effects.

Crude oil spilled in an estuarine marine environment caused short term, acute effects on salt marsh plants. Drastic changes in both diversity and numbers in the fish population were observed immediately after the spill. Initially zooplankton populations dropped, accompanied by phytoplankton blooms. As the oil dissipated, the zooplankton population increased rapidly. Long-term effects on fauna and flora were being studied. Migration of the oil via benthic animals and tidal percolations was observed as much as 42cm beneath the sediment surface. The sediments acted as an organic sink preserving the crude oil. Gas chromatographic analyses of sediment core sections indicate slow degradation of the crude oil with loss only of the lower molecular weight hydrocarbons after twelve months. (Katz)

AN EXPERIMENTAL OIL SPILL: THE DISTRIBUTION OF AROMATIC HYDROCARBONS IN THE WATER, SEDIMENT, AND ANIMAL TISSUES WITHIN A SHRIMP POND,
Texas Agricultural Extension Service, College Station.
B. A. Cox, J. W. Anderson, and J. C. Parker.
In: 1975 Conference on Prevention and Control of Oil Pollution:Proceedings, p 607-612, March 1975. 4 fig, 4 tab, 15 ref.

Descriptors: *Oil spills, *Oil pollution, *Organic compounds, *Fuels, *Invertebrates, *Shrimp, *Clams, *Oysters, Commercial shellfish, Mortality, Toxicity, Water pollution effects.
Identifiers: Experimental oil spills, Fuel oil(No. 2), *Napthalenes, Tissue analysis, Penaeus setiferus, Crassostrea virginica, Rangia cuneata.

In an experimental oil spill study No. 2 fuel oil was utilized in higher quantity than normal on a shrimp pond and the residue was not removed. Mortalities of juvenile shrimp, Penaeus setiferus, and other invertebrates were recorded for 96 hours. A peak in the level of mortality occurred 48 hours after the spill, coinciding with the peak in the concentration of napthalenes in the tissues of caged and free swimming organisms. Napthalene levels were also measured in clams, Rangia cuneata and oysters, Crassostrea virginica. (Katz)

AN ESTUARINE LOW-TEMPERATURE FIS KILL IN MISSISSIPPI, WITH REMARKS RESTRICTED NECROPSIES,
Gulf Coast Research Lab., Ocean Springs, Miss
R. M. Overstreet.
Available from the National Technical Inform tion Service, Springfield, Va. 22161 as COM-10306, $3.25 in paper copy, $2.25 in microfic Gulf Research Reports, Vol 4, No 3, p 328-3 1974. 19 fig, 3 tab, 62 ref.

Descriptors: *Fishkill, *Stress, *Temperatu *Mullet, *Saline water, *Thermal stre *Freezing, Pesticide residues, Mortality, F physiology, Freshwater fish, *Mississippi, Est ries, Microscopy, Analytical techniques, W pollution effects.
Identifiers: Mugil cephalus, Tissue analy Osmoregulation, Bayous, Thermal acclimation

In January 1973, large numbers of striped mu (Mugil cephalus), weighing approximately grams each, died in two freshwater localitie tidewater bayous in Mississippi. Fish of sev other species were found dead in other low sa estuarine areas. This particular incident is tributed to conditions of stress for fish incompl ly acclimated to the low temperatures that curred. The most deleterious stress was the saline water which probably allowed a breakd in the fishes' ion-osmoregulatory mechanis Striped mullet and other euryhaline fishes in sa ties greater than 6 ppt survived, as did freshw centrarchids and ictalurids in areas with d mullet. Starvation and high levels of pesti residues were also sources of stress during period of rapidly decreasing temperatures. (Ka W76-00321

EFFECTS OF PROPYLENE OXIDE SELECTED SPECIES OF FISHES,
Air Force Armament Lab., Eglin AFB, Fla.
R. C. Crews.
Available from the National Technical Info tion Service, Springfield, Va 22161 as AD-637, $3.25 in paper copy, $2.25 in microfiche Force Systems Command, Final Re November 1974. 14 p, 3 fig, 3 tab.

Descriptors: *Bioassay, *Lethal limit, Labora tests, *Toxicity, *Toxicants, Pollutants, Aq life, *Environmental effects, Sunfishes, Mu Freshwater fish, Water pollution sources, W pollution effects.
Identifiers: *Propylene oxide, *Fuel air e sives.

In conjunction with the fuel air explosives te and evaluation program, laboratory investiga into the effects of propylene oxide were ac plished using two freshwater fishes and marine species. For a 96-hour exposure, the an tolerance limits for propylene oxide wer parts per million for mosquitofish (Gambus finis), 215 ppm for bluegill (Lepomis macroc and 89 ppm for common mullet (Mugil ceph The results demonstrate that the toxici propylene oxide is sufficiently high to wa caution with its handling near freshwater marine aquatic systems. SUBLETHAL EFFECTS OF OIL, HEAVY METALS AND PCB'S ON MARINE ORGANISMS,
Texas A and M Univ., College Station. Dept. of Biology.
J. W. Anderson, J. M. Neff, and S. R. Petrocelli.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 514, $3.75 in paper copy, $2.25 in microfiche. In: The Mechanisms of Survival in Toxic Environments, American Society of Zoologists, December 1973. Symposium Volume, Academic Press, 1974. 47 p, 7 tab, 10 fig, 41 ref.

Descriptors: *Hydrocarbons, *Reviews, *Heavy metals, *Chlorinated hydrocarbon pesticides, *Polychlorinated biphenyls, Aquatic life, *Marine animals, Pollutants, *Growth rates, *Respiration, Iron, Manganese, Cobalt, Zinc, Mercury, Cadmium, Estuaries, Oil, Aroclor, Bioassay, Analytical techniques, Data collections, Lethal limit.
Identifiers: *Sublethal effects, Bioaccumulation, *Petroleum hydrocarbons, Chloride ion regulation.

This review described what has been and is now being done in the study of the sublethal effects of three major classes of pollutants commonly found in the estuarine environment. Heavy metals and chlorinated hydrocarbons are in general accumulated to a greater extent and bound to organisms much more firmly than petroleum hydrocarbons. Retention of petroleum derived hydrocarbons by animals may vary from several days to approximately two months and is species dependent. The class of petroleum hydrocarbons accumulated to the greates extent and retained the longest is the naphthalenes. Inorganic mercury, Aroclor 1254, and petroleum hydrocarbons affect the respiratory rate and chloride ion regulation of selected marine animals. There is some indication that the levels of petroleum hydrocarbons in the animal tissues may act to temporarily alter the regulatory ability of the test individuals. This interference was shown in several instances to the transitory, presumably due to the dynamics of hydrocarbon release from the tissues to the environment. (Katz)

PRELIMINARY ENVIRONMENTAL HAZARD ASSESSMENT OF CHLORINATED NAPHTHALENES, SILICONES, FLUOROCARBONS, BENZENEPOLYCARBOXYLATES, AND CHLOROPHENOLS,
Syracuse Univ. Research Corp., N.Y.
P. H. Howard, and P. R. Durkin.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 074, $8.50 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-560/1-74-001, November 1973. 263 p, 64 tab, 16 fig, 356 ref.

Descriptors: *Environmental effects, *Toxicity, *Phenols, *Organic compounds, *Lethal limits, Pollutants, Water pollution sources, Analytical techniques, Laboratory tests, Chemical properties, Hazards, Chlorination, Water pollution effects, *Reviews, *Bibliographies.
Identifiers: *Benzenepolycarboxylates, *Chlorophenols, *Chlorinated naphthalenes, *Silicones, *Fluorocarbons, Bioaccumulation, Halowax, Benzoic acids, Pthalic acids, Pyromellitic acids.

A review of five classes of chemical compounds covers production, environmental exposure, environmental effects, and toxicology. The classes are benzenepolycarboxylates (including phthalates), chlorinated naphthalenes, chlorophenols, silicones (siloxanes) and fluorocarbons (including chlorofluorocarbons). (Katz)
W76-00326

THE EFFECT OF PESTICIDES ON BYSSUS FORMATION IN THE COMMON MUSSEL, MYTILUS EDULIS,
Queens Univ., Belfast (Northern Ireland). Dept. of Zoology.
D. Roberts.
Environmental Pollution, Vol 8, No 4, p 241-254, June 1975. 5 fig, 3 tab, 18 ref.

Descriptors: *Mollusks, *Mussels, *Pesticides, *Organic compounds, *Bioindicators, Animal physiology, Growth stages, Toxicity, Water quality, *Polychlorinated biphenyls, *Pollutant identification.
Identifiers: *Scallops, *Endosulfan, Trichlorophon, *Byssys attachment, Mytilus edulis, Chlamys opercularis, Tissue analysis, Bioaccumulation.

Sea mussels (Mytilus edulis) were exposed to a range of pesticides and PCB's, several of which caused a reduction in byssal attachment at higher concentrations. In queen scallops (Chlamys opercularis) byssus formation was similarly affected. The sensitivity of mussels was greater at high temperatures and decreased with increase in size. Of the compounds tested, Endosulfan (organochlorine) was the most toxic, and Trichlorphon (organophosphate) was the least toxic. The probable cause of decreased byssal attachment was a reduction in pedal activity. It was suggested that byssogenesis tests offer a rapid and convenient technique for screening of potential marine pollutants. (Klein)

'MIGRATION' OF BLOWOUTS IN SEAGRASS BEDS AT BARBADOS AND CARRIACOU, WEST INDIES, AND ITS ECOLOGICAL AND GEOLOGICAL IMPLICATIONS,
Bellairs Research Inst., St. James (Barbados).
D. G. Patriquin.
Aquatic Botany, Vol 1, No 2, p 163-189, June 1975. 12 fig, 2 tab, 29 ref.

Descriptors: *Grasses, *Sediments, *Coasts, *Vegetation effects, Succession, Plant growth, Movement translocation, Environmental effects, *Migration, Soil erosion.
Identifiers: *Blowouts, *Seagrasses, Syringodium, Thalassia, *West Indies(Barbados-Carriacou).

Blowouts (grass-free depressions within seagrass beds) were described in detail. The seaward edges were steep and exposed rhizomes of Thalassia while the leeward edges sloped gently upward onto the seagrass plateau and were usually colonized by Syringodium. Evidence was given to suggest the migration of blowouts seaward. (Klein)

THE EFFECT OF THERMAL EFFLUENT UPON THE STANDING CROP OF AN EPIPHYTIC ALGAL COMMUNITY,
Alberta Univ., Edmonton. Dept. of Botany.
D. M. Klarer, and M. Hickman.
Internationale Revue der gesamten Hydrobiologie, Vol 60, No 1, p 17-62, 1975. 16 fig, 8 tab, 50 ref.

Descriptors: Effluents, *Bioindicators, *Ecosystems, *Algae, Heated water, *Thermal pollution, Biomass, Primary productivity, Water quality, *Standing crops, Diatoms, *Canada, Water pollution effects.
Identifiers: *Epiphyton, *Scirpus validus, *Fragilaria capucina, *Diatoma elongatum, *Lake Wabamum(Alberta).

Water temperature and dissolved oxygen levels varied while water chemistry remained unchanged at heated and non-heated sites in Lake Wabamum during an investigation of the epiphyton associated with Scirpus validus. Dissolved silica, nitrate-nitrogen, and phosphate-phosphorus levels varied with temperature and season. The epiphyton at all sites showed a spring maximum, a summer minimum, and an early autumn maximum. The spring dominants were Fragilaria capucina and Diatoma elongatum. The heated water caused a decrease in number of species and an increase in mean yearly standing crop size. (Klein)

EQUILIBRIUM AND STABILITY IN LABORATORY MODELS OF SEWAGE PONDS AND POLLUTED RIVERS,
Technische Universitat, Dresden (East Germany). Bereich Hydrobiologie.
D. Uhlmann, and F. Cramer.
Internationale Revue der gesamten Hydrobiologie, Vol 60, No 1, p 1-16, 1975. 13 fig, 2 tab, 21 ref.

Descriptors: *Ecosystems, *Primary productivity, *Laboratory tests, *Sewage, *Model studies, Environmental effects, Water quality, Nutrients, Food chains, Equilibrium, Stability, Phytoplankton, Zooplankton, Biomass, Water pollution effects, Water pollution sources.
Identifiers: *Simulated studies.

The ability of simple homogenous ecosystems with continuous or semicontinuous flow to respond to chemical and physical environmental changes was followed. Under constant environmental conditions the systems usually exhibited slow oscillations of the ecosystem parameters around an equilibrium state, (e.g. phytoplankton and zooplankton numbers). One mechanism suggested for functional stability was the inverse relationship between biomass and activity per unit biomass as observed in the laboratory models. The results were discussed with respect to short and long term effects of pollution abatement from flowing and standing waters. (Klein)

EFFECTS OF INGESTED MIREX AND DDT ON JUVENILE CALLINECTES SAPIDUS RATHBUN,
Florida Univ., Gainsville. Dept. of Zoology.
C. W. Leffler.
Environmental Pollution, Vol 8, No 4, p 283-300, June 1975. 8 fig, 1 tab, 34 ref.

Descriptors: *Shellfish, *Crabs, *Chlorinated hydrocarbon pesticides, *DDT, Animal physiology, Estuaries, Ecosystems, Environmental effects, Toxicity, Food chains, Juvenile growth stage, Water pollution effects.
Identifiers: Callinectes sapidus, *Mirex, *Blue crab, Tissue analysis, Bioaccumulation.

Mirex was a more toxic stomach poison in juvenile blue crabs, Callinectes sapidus, than DDT. High, subacute internal levels of Mirex (0.02-0.2 ppm) and DDT (0.8 ppm) caused metabolic rate elevations. Mirex concentrations 0.02 ppm and above inhibited the autotomy reflex. Subacute levels of DDT and Mirex did not affect osmotic and ionic regulation. The probable impact on blue crab populations of Mirex and DDT contamination of estuarine food chains was discussed. (Klein)

SHIFTS IN MICROBIAL GROUPS OF RIVER WATER UPON PASSAGE THROUGH COOLING SYSTEMS,
Ghent Rijksuniversiteit (Belgium). Inter-Faculty Centre for Environmental Sanitation.
W. Verstraete, J. P. Voets, and H. Vanstaen.
Environmental Pollution, Vol 8, No 4, p 275-282, June 1975. 5 tab, 8 ref.

Descriptors: *Heated water, *Cooling water, *Ecosystems, *Bacteria, Biomass, Microorganisms, Water quality, Water pollution sources, *Growth rates, Water pollution effects, E. coli.
Identifiers: *Industrial cooling plants, Faecal streptococci.

Three industrial cooling plants were studied for their possible impact on the microbiota of the cooling water. In spite of temperature increases, ranging from 5 to 10 degrees C, no drops in cell counts were observed. Various microbial groups including Escherichia coli and faecal streptococci populations were magnified from 1 to 7 times. A shift in dominance towards mesophilic and thermophilic micro-organisms was noted and a net decrease in sporulated versus total bacteria observed. These shifts seemed to result from the fact that the industrial coolers act as tubular microbial reactors, producing at rapid rates not only aquatic microorganisms, but also faecal bacteria. (Klein)

THE DEVELOPMENTAL STAGES OF PSEUDODIAPTOMUS MARINUS SATO (COPEPODA, CALANOIDA) REARED IN THE LABORATORY,
Hiroshima Univ. (Japan). Dept. of Fisheries.
S. Uye, and T. Onbe.
Bulletin of the Plankton Society of Japan, Vol 21, No 2, p 65-76, April 1975. 75 fig, 2 tab, 11 ref.

Descriptors: *Plankton, *Copepods, *Phytoplankton, *Primary productivity, *Growth stages, Laboratory studies, Life history studies, Water pollution effects.
Identifiers: *Pseudodiaptomus marinus, *Nauplis growth stages, *Copepodid growth stages, Monochrysis lutheri, Nitzschia closterium.

A neritic marine copepod, Pseudodiaptomus marinus, was reared through 3 generations in the laboratory with phytoplankton, Monochrysis lutheri and Nitzschia closterium, as diet. The development stages, 6 nauplius and 5 copepodid stages, excepting the adult, were described. This species was found to have the nauplius stage I, whereas eggs of 5 species of Pseudodiaptomus hatch directly into the nauplis stage II. Duration from hatching to the adult stage was about 23 days at 20 degrees C. (Klein)

TOXICITY OF A LINEAR ALKYLATE SULFONATE DETERGENT TO LARVAE OF FOUR SPECIES OF FRESHWATER FISH,
National Water Quality Lab., Duluth, Minn.
J. M. McKim, J. W. Arthur, and T. W. Thorslund.
Bulletin of Environmental Contamination and Toxicology, Vol 14, No 1, p 1-7, July 1975. 1 fig, 1 tab, 11 ref.

Descriptors: *Organic compounds, *Detergents, *Sulfonates, *Pikes, *Minnows, *Linear alkylate sulfonates, *Water quality, *Suckers, *Toxicity, Water pollution sources, Growth stages, Methdology, Environmental effects, Laboratory tests, Water pollution effects.
Identifiers: Bioaccumulation, *LC-50, Northern pike, Fathead minnows, White suckers, Smallmounth bass, Esox lucius, Catostomus commersoni, Micropterus dolomieu, Pimephales promelas.

The 96-hour LC-50 values for linear alkylate sulfonate (LAS) were similar for all species (Esox lucius, Catostomus commersoni, Micropterus dolomieu, and Pimephales promelas) tested. Smallmouth bass were the most resistant to LAS detergent during the 30-day exposure, followed by Northern pike, fathead minnows, and white sucker. Water hardness was tested to determine its effects on LAS toxicity. (Klein)
W76-00337

FISH TOXICITY OF S-METHYL FENITROTHION,
Atlantic Biological Station, St. Andrews (New Brunswick).
V. Zitko, and T. D. Cunningham.
Bulletin of Environmental Contamination and Toxicology, Vol 14, No 1, p 19-24, July 1975. 1 fig, 1 tab, 9 ref.

Descriptors: *Toxicity, *Analytical techniques, *Organic compounds, *Salmon, *Atlantic salmon, *Salmonids, *Organophosphorus pesticides, Mortality, Path of pollutants, Growth stages, Juvenile growth stage, *Pollutant identification, Water pollution effects.
Identifiers: *Fenitrothion, *S-methyl fenitrothion, Bioaccumulation.

The acute toxicity of S-methyl fenitrothion to juvenile Atlantic salmon (Salmo salar) was equal to that of fenitrothion. For both compounds the nominal concentration below which no mortality occurred in 96 hours was 0.63 milligrams per liter. (Klein)

BACTERICIDES USED IN DRILLING AND COMPLETION OPERATIONS,
Petrolite Corp., Tretolite Div. St. Louis, Mo.
T. J. Robichaux.
In: Conference on Environmental Aspects of Chemical Use in Well-Drilling Operations, May 21-23, 1975, Houston, Texas, 11 p, 3 tab, 4 ref.

Descriptors: Pollution, *Drilling, *Additives, *Toxicity, *Bactericides, Sulphur bacteria, Aquatic bacteria, Lethal limit, Water pollution effects, Drilling fluids, Slurries, Muds, Clays.

A list of typical drilling mud additives and their functions is given. Particularly in water base and low solids muds, the organic additives are subject to attack by microorganisms which are introduced into the mud with the water phase. Aerobic bacteria degrade or destroy the effectiveness of additives. To prevent this, bactericides are often added in preference to control by pH monitoring or control of ionic strength. Non-cationic bactericides such as aldehydes and phenols are added to drilling muds, while packer fluids and completion fluids make use of quaternary amines or acetate salts of cocoamines as the controlling bactericides. Because bactericides must be registered through Environmental Protection Agency procedures, a great deal is known about the effectiveness, treating concentration, and health and environmental hazards of the chemicals. The toxicity limits to fish and birds are listed as well as their persistency in the aquatic environment. The loss of these chemicals to the environment can be through (1) fluid loss to a permeable zone, (2) fluid loss to the target zone, (3) injection into a formation during fracing, (4) disposal of packer fluids and mud, and (5) spills. Removal may be effected by (1) dilution (2) adsorption on clay and soil, (3) deposition by flocculation, (4) biological decomposition when sufficiently diluted, (5) chemical reaction, and (6) polymerization at a high pH. (Brabbeer-NWWA)

ENVIRONMENTAL EFFECTS OF DRILLING MUDS AND CUTTINGS,
Shell Oil Co., Houston, Tex.
J. P. Ray, and E. A. Shinn.
In: Conference on Environmental Aspects of Chemical Use in Well-Drilling Operations, May 21-23, 1975, Houston, Texas, 16 p. 9 fig, 2 tab, 1 ref.

Descriptors: Pollution, *Marine fish, *Sea water, *Offshore platforms, Continental shelf, Turbidity, Chemistry, Mud, Chromium.
Identifiers: *Drilling rigs, *Ocean pollution, *Drilling cuttings.

Two basic topics are discussed: (1) the concentration of drilling mud discharge in the marine environment near drilling rigs, and (2) the observations of this near-rig environment by divers. Background values were obtained from literature for alkalinity, total dissolved solids, total suspended solids, total organic carbon and total chromium. These are compared with 12 samples taken around and within 60 yards of a drilling pla

orm in 245 feet of water. The samples are taken at he surface, midwater (120 ft) and bottom (245 ft). Each of the analyses varies little from the background except total dissolved solids which may be due to the analytical technique. Dilution urves are developed that indicate reduction of hromium below toxic level within 40 feet down urrent. Actual observations by divers of the rapid lispersion of drilling cuttings by ocean currents nd of the abundance of marine life on and around he platform are documented. (Bradbeer-NWWA)

URINARY EXCRETION OF QUINALDINE BY CHANNEL CATFISH,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
. B. Hunn, and J. L. Allen.
The Progressive Fish-Culturist, Vol 36, No 3, p 57-159, July, 1974. 1 fig, 1 tab, 12 ref.

Descriptors: *Urine, *Channel catfish, Fish natcheries, Iowa, Water pollution effects, Water pollution sources.
Identifiers: *Quinaldine sulfate, Excretion, Catherization, Fish anesthetic.

The study was undertaken to determine the rate of enal elimination of quinaldine following exposure of channel catfish obtained from the National Fish Hatchery, Fairport, Iowa. Following catheterization, the fish were placed in chambers and exposed to 30 mg/l of the anesthetic for not less than 0 minutes. Quanaldine was excreted in the urine of catfish following exposure to the anesthetic quinaldine sulfate, but the amount eliminated from he fish's body via the gill and/or gut can only be estimated. Urinary excretion of quinaldine was ess than 5 percent of the total body residue eliminated during 24 hours of withdrawal in freshwater. (Battles-East Central Oklahoma State)

RATES OF WATER ENTRY INTO THE SUBSOIL OF SEVERAL SOIL SERIES IN NEBRASKA,
Nebraska Univ., Lincoln. Conservation and Survey Div.
D. T. Lewis.
Research Bulletin 267, January 1975. 18 p, 3 fig, 3 tab, 15 ref, append.

Descriptors: *Soil disposal fields, *Percolation, *Sewage disposal, *Nebraska, Sewage treatment, Soils, Subsoil, Subsurface drainage, Waste water disposal, Groundwater movement, Percolating water, Soil water movement, Seepage, Infiltration, On-site investigations, Permeability, Septic tanks, Measurement.
Identifiers: *Percolation rates, Water entry rates.

Rates of water entry were measured for 11 soil series representing many of the soils in parts of Nebraska where urban growth is most intensive. Rates of water entry differed among soils even through a large amount of variation was evident within the same soil series. Differences in rate among holes at two different depths were not consistent even through it appeared that in some soils the rate beneath a clay pan was greater than in the clay pan. Rates of water entry measured at the same sites in spring when the soils were near field capacity were not different from those determined during the dry season of the preceding year, indicating that the longer wetting period used was adequate. Statistical analysis showed a highly significant negative relationship between both clay content and bulk density and rates of water entry. No significant statistical relationship between sand content and rate of water entry in the soils was evident. The soils studied either contained very little sand or the effect was masked by the compact nature of the soils that contained appreciable amounts of sand. Linear regression coefficients were found to be highly significant when clay content or bulk density were compared with rate of water entry and prediction equations were calculated. A summary of the use of rate of water entry or percolation test data to plan the size of an absorbing field for a septic tank was presented. (Sims-ISWS)

ION FLOTATION FOR COLOR REMOVAL FROM KRAFT MILL EFFLUENT,
British Columbia Univ., Vancouver.
D. W. Herschmiller, and R. M. R. Branion.
In: Proceedings of the 28th Industrial Waste Conference, Purdue University, May 1-3, 1973. p 224-233, 16 fig, 14 ref.

Descriptors: *Pulp wastes, *Flotation, *Color, *Waste water treatment, Wastes, Industrial wastes, Water pollution sources, Surfactants, Biochemical oxygen demand, Operating costs, Treatment facilities, Waste treatment, Water pollution treatment, Water quality control, Electric power demand, Costs, Economics, Ion transport, Sludge.
Identifiers: Kraft mills, Grenoble(France) recovery process, Chemical recovery.

A proposed ion flotation treatment for the purification of bleached kraft mill effluents is outlined. The process has been adapted from the Grenoble recovery process and utilizes chemicals available in the kraft cooking liquor cycle. In a limited number of tests, with nothing added to dissolve the surfactant, 5-day BOD removal varied between 18 and 30%, apparently as a result of both the natural surfactants and the ion flotation process. Although relatively costly, such a process can be readily used on dilute waste water streams; power and recovery tankage requirements are relatively small, and sludge accumulation is eliminated. (Sykes-IPC)
W76-00041

DESIGN FOR JOINT TREATMENT OF MUNICIPAL AND PAPER MILL WASTE AT LYNCHBURG, VIRGINIA,
Wiley and Wilson, Inc., Lynchburg.
W. H. Clingenpeel, and M. K. Jones.
In: Proceedings of the 28th Industrial Waste Conference, Purdue University, May 1-3, 1973. p 109-116, 2 fig, 6 ref, 1 tab.

Descriptors: *Pulp wastes, *Municipal wastes, *Treatment facilities, *Waste water treatment, Water pollution sources, Industrial wastes, Wastes, Waste treatment, Water pollution control, Water quality control, Sludge disposal, *Virginia, Mulching, Landfills.
Identifiers: Lynchburg(Virginia), Board mills, Waste paper.

Waste treatment facilities designed for joint treatment of effluent from the Mead Corporation pulp and paperboard mill and municipal wastes from the city of Lynchburg, Virginia, are described. The domestic and industrial wastes enter the plant through separate interceptors. The industrial waste receives primary settling before being combined with the domestic waste at the effluent end of the grit chambers. Sludges are disposed of as landfill, although they could possibly be used as mulch materials or soil conditioners in the future. (Sykes-IPC)

EFFECT OF BARK ADDITION UPON THE DEWATERING PROPERTIES OF BIOLOGICAL SLUDGES,
National Council of the Paper Industry for Air and Stream Improvement, Inc., Kalamazoo, Mich. Central-Lake States Regional Center.
D. W. Marshall, and W. J. Gillespie.
In: Proceedings of the 28th Industrial Waste Conference, Purdue University, May 1-3, 1973. p 755-764, 7 fig, 13 ref, 2 tab.

Descriptors: *Sludge treatment, *Dewatering, *Bark, Water pollution sources, Wastes, Industrial wastes, Sludge, Hardwood, Softwood, Wood wastes, Particle size, Waste treatment, Biological treatment.

The effect of added bark particle size distribution on the dewatering properties of waste hydrous sludge-bark mixtures was investigated. Also, the conditioning properties of hardwood vs. softwood barks, as well as the magnitude of bark addition required for optimum dewatering results were examined. It was determined that the optimum conditioning of biological sludges required size range selection of bark within a range of 20 to 40 mesh. Net solids loading rates increased linearly with bark addition. However, solids retention increased as the uniformity of particle sizes constituting the bark supplement decreased. In this study, hardwood bark was found unsuitable for the conditioning of biological sludges, and it had a detrimental effect on the superior softwood when the two were combined. (Sykes-IPC)
W76-00043

COMPARATIVE STUDY OF THERMAL TECHNIQUES FOR SECONDARY SLUDGE CONDITIONING,
National Council of the Paper Industry for Air and Stream Improvement, Inc., Kalamazoo, Mich. Central-Lake States Regional Center.
D. W. Marshall, and W. J. Gillespie.
In: Proceedings of the 29th Industrial Waste Conference, Purdue University, May 7-9, 1974. p 589-596, 7 fig, 17 ref, 1 tab.

Descriptors: *Sludge treatment, *Heat treatment, *Pulp wastes, Temperature, Wastes, Industrial wastes, Water pollution sources, Waste treatment, Solid wastes, Oxidation, Hydrolysis, Biochemical oxygen demand, Nitrogen, Sludge.
Identifiers: *Kraft mills, *NSSC pulp mills.

LIBRARY U. OF I. URBANA, ILLINOIS

Oxidative thermal conditioning of sludge from an integrated bleached kraft mill with supplemental neutral sulfite semichemical pulp production was evaluated at temperatures ranging from 300 to 500F. For nonoxidative conditioning the temperature range was extended to 600F. Reaction time at given temperatures was varied from zero to 40 minutes. Experimental analyses indicate that available thermal conditioning processes, whether nonoxidative or otherwise, are capable of effecting equivalent degrees of sludge conditioning which, for a given sludge, is dependent upon the volume of solids hydrolyzed. The capacity of thermal conditioning processes to hydrolyze sludge solids is primarily a function of temperature. Heat treatment liquors associated with oxidative and nonoxidative conditioning processes contain BOD concentrations of comparable magnitude, and those generated in these tests contained nitrogen concentrations up to 50% greater than that required for their biological treatment. (Sykes-IPC)
W76-00046

A STATISTICAL DOCUMENTATION OF THE PERFORMANCE OF ACTIVATED SLUDGE AND AERATED STABILIZATION BASIN SYSTEMS OPERATING IN THE PAPER INDUSTRY,
National Council of the Paper Industry for Air and Stream Improvement, Inc., Kalamazoo, Mich. Central-Lake States Regional Center.
J. J. McKeown, D. B. Buckley, and I. Gellman.
In: Proceedings of the 29th Industrial Waste Conference, Purdue University, May 7-9, 1974 p 1091-1110. 8 fig, 5 ref, 10 tab.

Descriptors: *Pulp wastes, *Activated sludge, *Treatment facilities, *Aerated lagoons, *Waste water treatment, Wastes, Industrial wastes, Waste treatment, Water pollution sources, Performance, Pulp and paper industry, Temperature, Biological treatment, Water purification, Statistics.

The effluent quality released from 53 biological systems treating 12 categories of pulp and paper production wastes is summarized. A review of existing field data is made to develop a temperature relationship for systems which reflect climatic response. It is suggested that the performance of biological treatment systems must be examined using the appropriate time scale for characterizing effluent performance and variability. (Sykes-IPC)

PHYSICAL-CHEMICAL AND BIOLOGICAL TREATABILITY INVESTIGATIONS AND PROCESS DESIGN FOR A TALL OIL WASTE WATER,
Associated Water and Air Resources Engineers, Inc., Nashville, Tenn.
C. E. Adams, and F. G. Ziegler.
In: Proceedings of the 29th Industrial Waste Conference, Purdue University, May 7-9, 1974, p 923-944. 23 fig, 5 ref, 12 tab.

Descriptors: *Waste water treatment, *Treatment facilities, *Aerated lagoons, *Design criteria, Wastes, Industrial wastes, Water pollution sources, Biological treatment, Biochemical oxygen demand, Sludge, Settling basins, Capital costs, Operating costs, Costs, Waste treatment, Water pollution control, Chemical wastes.
Identifiers: *Tall oil, *Rosin fatty acids.

Waste water from a mill located in the southeastern United States which produces fatty acids, pitch rosin, and acid-refined and distallation-refined tall oil is characterized; and the results of treatability investigations are presented. The two-phase investigation consisted of an examination of physical-chemical methods required to remove oily and emulsified materials from solution, followed by biological studies on the actual effluent from the physical-chemical plant so that the influent to the biological system would be representative of full-scale performance. The physical-chemical treatment consisted of pH adjustment and chemical addition to break the emulsion and form a coagulated sludge which was removed by gravity sedimentation. The biological treatment system was designed for a maximum BOD discharge of 40 lb/day (Approximately 0.24 lb/ton of tall oil). The aerated lagoon is followed by a 3-day settling basin designed to accumulate sludge produced within the aerated lagoon for a period of 5 years. Cost estimates (Capital and operating) are included. (Sykes-IPC)
W76-00049

THE RECYCLING OF KRAFT BLEACH WASTES,
Montana State Univ., Dept. of Civil Engineering.
R. L. Sanks.
Journal Water Pollution Control Federation, Vol 47, No 7, p 1924-1932, July, 1975. 1 fig, 12 ref, 8 tab.

Descriptors: *Bleaching wastes, *Recycling, *Ion exchange, *Waste water treatment, Color, Resins, Activated carbon, Water reuse, Water pollution sources, Wastes, Industrial wastes, Waste treatment, Pulp wastes, Costs, Labor, Chemicals, Maintenance, Effluents, Carbon, Separation techniques, Water purification, Water quality control, Water pollution treatment, Water conservation, Industrial water.
Identifiers: *Kraft mills.

Twenty resins and seven activated carbons were evaluated for the removal of color and minerals from a kraft bleach plant effluent. The best resins were generally equal to the best carbons for decolorization. Single-stage ion-exchange with starvation regeneration produced reusable water that was adequate for unbleached pulping. Two-stage ion-exchange produced reusable water adequate for bleached pulping. The cost including amortization over 10 years at 9% interest, labor, chemicals, and maintenance varied from $0.42/1000 gal ($0.11/cu m) to $1.38/1000 gal ($0.36/cu m) of product depending on the assumptions. Ion-exchange thus seems to be competitive with other processes. (Witt-IPC)

WASTE TREATMENT VARIABLES FOR KRAFT MILLS,
Paper Industry Engineers, Inc., Atlanta, Ga.
V. B. Bodenheimer.
Southern Pulp and Paper Manufacturer, Vol 38, No 7, p 29-32, July, 1975. 2 fig, 2 ref, 4 tab.

Descriptors: *Pulp wastes, *Aerated lagoons, *Activated sludge, *Waste water treatment, Biochemical oxygen demand, Temperature, Retention, Time, Depth, Lagoons, Oxidation lagoons, Wastes, Waste treatment, Industrial wastes, Water pollution sources, Suspended solids, Sulfite liquors, Water pollution treatment, Water quality control, Operations, Design, Control, Treatment facilities, Biological treatment, Aeration.
Identifiers: *Kraft mills, *NSSC pulp mills.

Important parameters affecting the operation of naturally and artificially aerated lagoons and conventional and oxygen-aided activated sludge systems treating kraft mill and kraft/neutral sulfite semichemical mill wastes are defined. Formulas are given showing the effects of initial BOD, temperature, time (retention time in days), and depth on the final BOD of effluent treated in naturally and artifically aerated lagoons. In the activated sludge treatment systems, final BOD of the treated effluent depends on the initial BOD, mixed liquor suspended solids (suspended solids concentration after mixing of influent waste and recycled sludge), temperature, and a time factor (roughly equivalent to the total aeration time in days). The formulas are of value for waste treatment system design and control purposes. Suspended solids removal is an area that needs more study. The consensus is that the standard for suspended solids for bleached kraft pulp is 5.5 lb/ton. Treatment systems meeting this standard are natural lagoons or low-rate aerated systems having at least 26 days total retention time. The advantages and disadvantages of naturally and artificially aerated lagoons and conventional activated sludge treatment are listed. (Witt-IPC)

CHANGES IN RECIRCULATED WATER IN PAPER MACHINE OVER A SIX DAY PERI (VERAENDERUNGEN IM KREISLAUFWASS EINER PAPIERMASCHINE WAEHRE EINER 6 TAGE-BETRIEBSPERIODE),
Institut Papiertechnische Stiftung, Mun (Germany).
J. Weigl, and M. Baumeister.
English translation of Wochenblatt fur Pap fabrikation, Vol 103, No 11/12, p 425-428, June 1975. 9 fig, 9 ref, 1 tab.

Descriptors: *Recirculated water, *Water re *Industrial water, *Pulp and paper indus Recycling, Water, Sulfates, Ions, Bacteria, E trolytes, Flocculation, Water pollution cont Water quality, Foreign countries, Alumin Water conservation, Europe.
Identifiers: *Paper machine, Aluminum sulf Polyethylenimine, Retention aids, Germany.

The changes in the water of a partly closed circ tion system on a paper machine at Munch Dachauer Papierfabriken Heinrich Nico GmbH (Germany) were studied. There was an crease in sulfate ion concentration during op tion, but there was no aluminum ion in the fluent. This indicates that the aluminum sul added to polyethylenimine as a retention aid fo a complex which is practically quantitati retained. The bacterial count decreased steac probably due to flocculation by the increa electrolyte concentration. (Ward-IPC)

REMOVAL OF CADMIUM FROM WATERS AND WASTES BY SORPTION ON HYDROUS METAL OXIDES FOR WATER TREATMENT,
Monroe County Community Coll., Mich.
H. S. Posselt, and W. J. Weber, Jr.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 89-108. 6 fig, 14 ref.

Descriptors: *Waste water treatment, *Cadmium, *Sorption, *Water treatment, Aluminum, Iron oxides, Manganese, Metals, Water quality control, Water pollution sources, Water pollution control, Water purification, Pollutants.

The sorption behavior of hydrous oxides of Al(III), Fe(III), and Mn(IV) toward trace amounts of cadmium was examined over a wide range of conditions. The uptake of cadmium on the sorbents can be described by the Langmuir sorption equation. Sorption rates on highly dispersed oxides are extremely rapid, with equilibrium occurring in less than 10 minutes. Both the limiting sorption capacity and adsorption affinity for cadmium increased beyond the pH of zero point of charge (ZPC). Hydrous manganese dioxide, prepared by reduction of permanganate, was superior to the Al and Fe hydrous oxides. The practical range for Al(III) salts is limited due to the formation of aluminate ion and a relatively high ZPC for insoluble Al hydrolysis products. The sorption of cadmium exhibits a small dependence on ionic strength. Competitive effects from uptake of calcium or from chloride complexation are also weak. These findings suggest that sorption on hydrous oxides of Mn(IV) and Fe(III) is a feasible approach for removing cadmium from water and waste waters. (See also W76-00102) (Witt-IPC)

INFLUENCE OF SURFACE OXIDES ON ADSORPTION AND CATALYSIS WITH ACTIVATED CARBON,
Maryland Univ., College Park. Dept. of Civil Engineering.
C. Ishizaki, and J. T. Cookson, Jr.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 201-231. 10 fig, 34 ref, 13 tab.

Descriptors: *Organic compounds, *Waste water treatment, *Activated carbon, *Adsorption, Oxides, Separation techniques, Oxygen, Water pollution sources, Carbon, Water treatment, Water quality control, Oxidation, Catalysis.
Identifiers: Methylation, Ammonium persulfate, Outgassing, Butyl mercaptan, Butyl disulfide, Decane, p-Hydroxybenzaldehyde, Filtrasorb 200 carbon.

The surface of Filtrasorb 200 activated carbon was modified by chemical and physical treatments, including methylation, oxidation with aqueous solution of ammonium persulfate, vacuum outgassing, and dry oxidation with oxygen, and the adsorption capabilities of the carbons for butyl mercaptan, butyl disulfide, decane, and p-hydroxybenzaldehyde were determined and compared to those of untreated Filtrasorb for the same organic compounds. The adsorption capacities of the untreated and modified carbons were nearly the same. The minor differences (10%) noted were due to preferential adsorption of water by the carbon. Acidic surface oxides on the carbon reduced the affinity of aromatic adsorbates but not the rate of adsorption. (See also W76-00102) (Witt-IPC)

Descriptors: *Waste water treatment, *Activated carbon, *Chlorination, *Organic compounds, *Adsorption, Separation techniques, Phenols, Carbon, Oxides, Chlorine, Water treatment, Water purification, Water quality control, Water pollution sources, Disinfection.
Identifiers: p-Nitrophenol, Filtrasorb 400 carbon, Sodium hypochlorite.

Following reaction of Filtrasorb 400 activated carbon with NaOCl and determination of residual chlorine, the carbon was analyzed for its content of surface oxides and its adsorption capacity of p-nitrophenol and phenol after no further treatment, washing, drying, or drying plus outgassing. A definite relationship was found between the buildup of acidic surface oxides and the degree of treatment with free chlorine. The surface has a maximum level of oxides that it can accomodate, but many of the oxides or oxygen-containing reaction products are volatile. The adsorption capacity of carbon for p-nitrophenol and phenol was decreased by repeated cycles of treatment with free chlorine and drying after each cycle. The presence of fixed oxides reduced the adsorption capacity. (See also W76-00102) (Witt-IPC)

INVESTIGATIONS ON THE CONDITIONS FOR WET AIR OXIDATION OF COLLAGEN AND TALLOW AS MAIN COMPONENTS OF TANNERY WASTE, (IN JAPANESE),
Yamazaki Chemical Lab., Yoshii (Japan).
K. Shirai, and H. Okamura.
Hikaku Kagaku, (Leather Chemical), Vol 21, No 1, p 10-17, June, 1975. 7 fig, 3 tab, 6 ref.

Descriptors: *Industrial wastes, *Waste water treatment, *Tannery wastes, Foreign research, Chemical oxygen demand, Suspended solids, Coagulation, Activated sludge.
Identifiers: *Wet-air oxidation, Collagen, Tallow.

The high concentrations of chemical oxygen demand (COD) and suspended solids (SS) in tannery wastes make it impossible to achieve an acceptable level of pollution by conventional techniques utilizing coagulating agents and activated sludge. The wet air oxidation process, which has proven successful for purifying domestic wastes, is generally considered to decompose all organic solid wastes to a clear solution by means of high temperature and high pressure oxygen. This process is expected to be suitable for the treatment of tannery wastes. The reaction conditions for wet air oxidation of collagen and tallow, the main components of tannery wastes, were investigated. An aqueous suspension of collagen and tallow, containing 20 g/liter COD, was reacted with air at a pressure of 50-110 kg/sq cm and a temperature of 105-300 C. The COD content of the substrate decreased to 10-20 percent at its lowest level (Based on the charged COD) after being subjected for sixty minutes to a reaction temperature higher than 180 C. When acidic reaction medium was used in place of pure water and a larger quantity of substrate was charged, a higher rate of COD removal was attained. Although complete degradation of collagen and tallow can not be achieved by wet air oxidation alone, this process is a suitable method for the preliminary treatment of tannery waste prior to conventional coagulation. K. Yasutome, T. Takiguchi, S. Shimizu, S. Nakano, and A. Sato.
Kogai, (Pollution Control) Vol 10, No 4, p 20-27, July, 1975. 6 fig, 2 tab, 3 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Dyes, *Textiles, *Ozone, Emulsions, Oily water, Turbidity, Color, Sludge.
Identifiers: Oil/water emulsions.

Oil/water emulsions are frequently used in the oiling process of fiber dyeing. These emulsions produce high values of COD, BOD, and n-hexane extractables in the waste water which in turn increase the turbidity. Various types of dyeing waste water were subjected to treatment by ozone with an inorganic coagulant, and the removal of the emulsion was determined. The process was capable of removing around 100 percent of the oil emulsion and colored organic compounds. The volume of sludge formed was one-third to one-half of the normal volume. (Orr-FIRL)

Identifiers: Chemical treatment, Physical treatment, *India.

The annual production of skins in India is estimated to be 15.86 million pieces. Leather manufacturing includes pre-tanning, tanning and post-tanning operations. The general methods used for the treatment of tannery wastes fall into four classifications: separation and removal; alteration; combination; and, elimination. The methods can be further divided into either physical, chemical, or biological treatment methods. Physical treatment methods include simple sedimentation, sedimentation with controlled pH, and lagooning. Chemical treatment methods include treatment with ferric chloride or alum, flue gas and lime treatment, ion exchange processes, chlorination, and adsorption on activated charcoal. Biological methods are trickling filtration and activated sludge treatment as well as various low cost methods. The low cost methods are non-mechanized methods, such as oxidation ponds and anaerobic lagoons, and mechanical methods, such as oxidation ditches and aerated lagoons. Five process combinations employing low cost methods were studied. Simple settling of the tannery effluent in settling tanks for 8 hours produced a percent reduction in BOD, COD, and suspended solids of about 43, 42, and 82, respectively. Tannery effluents in India should be treated by simple settling for 8 hours followed by lagooning or biological or chemical treatment depending on the land availability and cost of treatment. Identifiers: Cokery effluents, Ferrous sulfate, Orthophosphoric acid.

An improved method for the removal of oils from phenolic waste waters generated in cokeries is described. It involves settling and subsequent flotation. The waste water is pre-treated with ferrous sulfate to facilitate the coagulation of colloidal oil particles. Ferrous sulfate is added at a concentration of 30-70 mg/liter. Orthophosphoric acid is added to prevent the oxidation of bivalent iron into the trivalent form. Up to a 50 percent reduction can be achieved in the residual oil content. (Takacs-FIRL)

Identifiers: Basic dyes, Disperse dyes, Sulfide dyes, Acidic dyes.

Activated carbon adsorption for the treatment of dyeing waste water is reviewed. The adsorptivity of dyes depends on the type of activated carbon employed, chemical structure of the dyes, solution pH, solution temperature, contacting method of solution with activated carbon, and composition of the waste water. Basic dyes such as Malachite Green and Rhodamin B are adsorbed well by most activated carbons, while the adsorption of sulfide dyes such as Sulfur Black BRX is poor. The adsorption of acidic and basic dyes by fabric is 60 to 80 percent, but that of sulfide dyes is less, therefore sulfide dyes tend to appear in higher concentrations in the waste water. The removal of disperse dyes from waste water by either carbon adsorption or coagulation precipitation is not effective; each method provides only 70 to 80 percent removal efficiency. If the two methods are used successively, 90 to 95 percent of disperse dyes can be removed from water. Surfactants contained in all dyes produce high BOD and COD values in the waste water. Activated carbon is the most effective method for the removal of surfactants from the waste water. (Katayama-FIRL)

Descriptors: *Waste water treatment, *Industrial wastes, *Oil industry, Activated sludge, Biodegradation, Microorganisms, *Biological treatment.
Identifiers: Naphthenic acids, Sulfonic acids, Petroleum refineries.

Experimental studies were conducted on the biodegradation of residual waters from oil refineries by activated sludge in the presence of naphthenic and sulfonic acids. Naphthenic and sulfonic acids are constant constituents of waste water generated in petroleum refineries. The experimental installation was a continuous two-level process utilizing completely mixed activated sludge. The activated sludge was obtained from domestic sewage sludge. By using a biological sludge adapted to naphthenic acids, it was possible to achieve 97 percent biodegradation after 6 hours of treatment. The sulfonic acids had no toxic effects on the biological system, but reduced the oxygen transfer and were only partially degraded thus increasing the oxygen demand of the treated effluent. Addition of a second respiration substrate, lactose, increased the biodegradation. Since there are specific bacteria which are capable of degrading naphthenic acids, these specific specialized microbial populations should be used. Naphthenic acids are used as the growth substrate by these microorganisms. There is no universal activated sludge that can be used for the treatment of refinery wastes containing naphthenic acids. Identifiers: Total oxidation, Physico-chemical treatment, Inks.

A comparative study was made of two waste water treatment pilot plants, one utilizing activated sludge, the other a total oxidation plant, in purifying the effluents from a corrugated cardboard box factory. The principal pollution problems come from the gluing and printing stages of production. The dyes and inks used in the latter stage were found to have a toxic effect on the microflora of the biotreatment plant and were therefore kept separate for testing purposes. In addition, phosphorus, nitrogen and alum had to be added as nutrients. The activated sludge plant, operated under these conditions, eliminated 92.6 percent of the BOD and 88.4 percent of the COD from the inflow in 2.5 hours, while the total oxidation system eliminated 96.2 percent BOD in 24 hours. Although it seemed preferable in many ways to use total oxidation because of greater structural simplicity and lower operating costs, the choice eventually was the bio-treatment plant (Which is now being used because it occupies about one fifth the space. A physico-chemical purification plant is used in conjunction with the activated sludge in order to treat the dyes used in printing. (Morrow-FIRL)

N THE WET AIR OXIDATION PRODUCTS OF OLLAGEN AND TALLOW, (IN JAPANESE),
amazaki Chemical Lab., Yoshii (Japan).
. Shirai, and H. Okamura.
itaku Kagaku, Vol 21, No 1, p 18-24, June, 1975. fig, 5 tab, 4 ref. (English summary).

escriptors: *Waste water treatment, *Industrial astes, *Tannery wastes, Foreign research, itrogen compounds, Chemical oxygen demand, mino acids.
dentifiers: *Wet air oxidation, Collagen, Tallow.

he wet air oxidation of tannery wastes was in-estigated. The reaction conditions for the wet air xidation of collagen and tallow, the main com-onents of tannery wastes, were examined. The nalytical data of the oxidation products of col-gen and tallow are discussed. The nitrogen con-nt of oxidized collagen and the fat content of ox-ized tallow were both considerably decreased by e use of a high oxidation temperature and acidic edium. This decrease agrees with the chemical xygen demand (COD) change during the period oxidation but seems to be more definitive than at of COD. Removal rates for nitrogen com-ounds increased in the following order: COD less an total nitrogen less than amino nitrogen less an hydroxproline nitrogen. This order indicates e complexity of the composition of intermediate roducts in wet air oxidation. The quantity of com-ned amino nitrogen and hydroxproline nitrogen ecreased by wet air oxidation but did not cause increase in the quantity of free amino nitrogen nd hydroxyproline nitrogen. Only a limited mount of low molecular weight substances, such amino acids, are produced during the wet air ox-ation of collagen and these are immediately con-erted into simpler compounds. (Orr-FIRL)

ON THE WASTE WATER TREATMENT SYSTEM BY PRESENT LANCY METHOD (GENJO NI OKERU RANSHI HOSHIKI NI YORU HAISUISHORI SHISUTEMU NI TSUITE),
K. Ishiyama.
Boshoku Kanri, (Rust Prevention and Control), Vol 19, No 7, p 12-18, July, 1975. 8 fig, 6 tab, 2 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Metals, Chemical reactions, Water conservation, Water reuse, Sludge.
Identifiers: *Metal finishing industry wastes, *Lancy method.

The Lancy method for the purification of waste water from metal surface treatment industries was discussed. The Lancy method utilized chemical rinsing processes which were incorporated into the metal surface treatment processes. The processed metal surfaces were cleaned at the end of each process by a chemical reagent rather than with water; therefore, the chemical cleaning process could be made effective by choosing the appropriate chemical reagent for each manufacturing process and unnecessary water rinsing was considerably reduced. The sludge formed from chemical rinsings was generally heavy and consisted of large flocs. Sludge precipitation was rapid and a high sludge concentration (5 percent) could be obtained. The amount of sludge produced was 10 percent of the amount produced by conventional coagulation precipitation treatment. Since chemical rinsing steps were employed at each manufacturing process, the sludge produced contained only the simple metal composition characteristic to the process, which made sludge disposal easier. As much as 97 percent of the rinse water required in most of metal surface treatment industries could be saved if the Lancy method is used. The water used in the final rinsing step would have a less complicated chemical composition, facilitating purification for water reuse. (Katayama-FIRL)

WASTE WATER DISPOSAL OF PAINTING FACTORY AND CLOSED-SYSTEMATIZATION (TOSO KOJO NO HAISUI SHORI TO KUROZU-DO-SHISUTEMU KA),
Y. Kinugasa, and T. Kawanishi.
Kankyo Sozo, (Environmental Creation), Vol 5, No 6, p 67-71, June, 1975. 4 fig, 8 tab.

Descriptors: *Waste water treatment, *Industrial wastes, Water circulation *Water reuse, Closed conduits, Cooling water, Sewage, Suspended solids, Filtration, Ion exchange, Zinc, Activated carbon, Reverse osmosis, Tertiary treatment, Water quality, Chemical oxygen demand, Biochemical oxygen demand, Alkyl benzene sulfonates, *Recycling.
Identifiers: *Paint factory wastes, Zero discharge, Closed water cycles.

A closed-cycle for the waste water from paint factories was described. Waste water was classified into three groups: waste cooling water from machines; waste water from the painting processes; and, domestic waste water from factory workers. The waste cooling water was cooled and filtered to remove suspended solids (SS), and then recirculated. The waste rinse water was filtered to remove SS and n-hexane extractable components, further treated with activated carbon to adsorb COD components, and finally by ion exchange to remove the remaining zinc. The waste water produced by factory processes other than rinsing had a variable pH and contained larger quantities of waste materials, necessitating more extensive treatment. The pH of this waste water was adjusted by slaked lime, and coagulation precipitation using ferric chloride was performed before filtration. The filtered water was then treated with activated carbon and reverse osmosis was employed for final treatment. This advanced treatment produced reusable water and contained one ppm BOC, 5 ppm COD, 2 ppm SS, 0.05 ppm Zn, and 0.05 ppm ABS. The system can recirculate 95 to 98 percent of the waste water generated by paint factories. (Katayama-FIRL)

PRESENT SITUATION OF WASTE WATER FROM PRINTING AND FILM DEVELOPING PLANTS AND TREATMENT (INSATSU SHASHIN GENZO KOJO HAISUI NO JITTAI CHOSA TO SHORI NI TSUITE),
S. Sasaki.
Kankocho Kogai Senmon Shiryo, (Government Offices Pollution Data), Vol 10, No 4, p 63-74, July, 1975. 11 fig, 9 tab, 5 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, Water quality, Standards, Heat treatment, Ion exchange, Ozone, *Oxidation.
Identifiers: *Photographic processing wastes, Electrolytic oxidation.

The quality of waste water from 7 printing and 9 film developing factories was determined with respect to pH, BOD, COD, manganese, zinc, lead, chromium, cadmium, and cyanide. All concentrations present in the discharged waste water from the film developing factories were within water quality standards, however, the waste developing solution and waste fixing solution had a high COD content which was treated before final discharge. High cyanide ion concentrations were generally produced by the bleaching process of film developing; the waste bleaching solution also had a high iron content. These ions were present in the form of potassium ferricyanide or ferricyanide. A heat decomposition method with sodium hydroxide and sodium hypochlorite or a precipitation separation method with ferrous sulfate was used to treat the waste bleaching solution, achieving less than 0.5 ppm cyanide in the treated water. Ion exchange can also be used to treat waste bleaching solution. Cadmium and manganese were removed by precipitating as hydroxides at a pH of 11 to 12. Cadmium can be further removed by the addition of hydrogen sulfide. The electrolytic oxidation method for COD treatment was unsatisfactory, giving only 11 percent COD removal. The ozone oxidation method achieved 74 percent COD removal if the COD content in the waste water was low; the removal efficiency decreased with increasing COD content. One hundred percent efficiency for BOD and COD removal can be expected from the combustion method; however, this method causes secondary pollution by forming sulfur oxides. (Katayama-FIRL)

A surface reaction rate expression was developed to describe the heterogeneous reaction between aqueous free chlorine and granular activated carbon. This expression was then incorporated into a pore diffusion model and the relevant partial differential equations with the corresponding boundary conditions were solved for the case of (1) a

LIBRARY U. OF I. URBANA

constant concentration batch reactor and (2) a closed batch reactor. The solutions were then compared to similar batch data in order to evaluate the pore model constants. A packed bed reactor model was then solved using the rate information from the batch mathematical models and experimental data. The predicted results from the packed bed model were then compared to experimental results. The effect of particle size on the rate of removal of free chlorine was investigated both in batch and packed bed column form. The effect of pH on the rate of reaction was studied in the pH range of 4-10. The pH affects the rate insofar as it affects the distribution of free chlorine between OCl and HOCl. Temperature effects were also studied in the range 2-35C. The effect of temperature on the surface dissociation rate constant corresponds to the Arrhenius law.

Descriptors: *Water management(Applied), *Waste water treatment, *Recycling, *Reclaimed water, Semiarid climates, Water utilization, Water resources, Water reuse, Waste water disposal, Sewage effluents, Sewage treatment, Water quality.
Identifiers: *High plains region.

Several changes in broad national programs that have the potential to influence the management of wastes in the United States are briefly discussed with an effort made to relate these changes to the High Plains. A working example of the wastewater management system is Muskegon County, Michigan is described which achieves a high degree of treatment so that reclaimed water meets Public Health Service drinking water quality standards. Emphasis is on the land treatment of sewage effluent and economic feasibility of wastewater recycling. (See also W76-00179) (Robinett-Arozona)

BREAKTHROUGH IN SEWAGE TREATMENT-A USER'S VIEW,
J. Eno.
Water, No 4, p 18-19, July, 1975. 1 fig.

Descriptors: *Waste water treatment, *Treatment facilities, *Sewage treatment, *Costs, Economic efficiency, Energy conservation, Sludge.
Identifiers: *Deep Shaft Process.

A pilot plant study of the deep shaft aeration process (Developed by ICI) for effluent treatment is being conducted at the Billingham (Cleveland) sewage disposal works of the Northumbrian Water Authority. Operation started in July 1974; the pilot plant works in parallel with the main sewage treatment plant. Preliminary results suggest the need for further development to study plant parameters under variable operating conditions and on a larger scale before the system is generally accepted as a desirable alternative to conventional treatment methods. Of the claims by the manufacturer for this process, lowered sludge production and power consumption are the most important. With an appropriate balance of retention period, effluent substrate concentration, and degree of endogenous respiration, the treatment unit should produce a low quantity of well mineralized sludge. The cost of this goal needs to be evaluated in terms of process costs before any economical advantage can be determined. The claims of energy conservation, and therefore costs, must be compared with the economics of percolating filter plants. The relationship of construction costs to the biological kinetics of the process must be investigated. The interrelation of shaft diameter and construction costs becomes significant when the proposed plant size is between the practical limits of drilling and mining technology. (Orr-FIRL)

NEW CHLORINE APPLICATION IMPROVES VIRAL KILLS.
Water and Sewage Works, Reference Number, R68-R70, R72, R74, April 30, 1975. 7 fig.

Descriptors: *Waste water treatment, *Disinfection, *Chlorination, *Pathogenic bacteria, *Viruses, Bacteria, Sewage treatment, Equipment, Jets, Mixing, Public health.

Disinfection of waste water by the direct application of raw chlorine gas has been accomplished by the use of a gas nozzle unit. The disinfection unit incorporates a double set of nozzles, one for motive flow and the other for disinfectant. Use of chlorine gas reduces the time required to effect bacterial kill. The major portion of the bacteria kill occurs almost immediately (Within 3 seconds). The new disinfection process also shows high potential for virus inactivation. The pump, discharge manifold and jet nozzle of the disinfection unit are furnished completely assembled which makes installation of the equipment in an existing plant a relatively simple process. The pump is lowered into the chamber. Anchors are then placed in the floor and in the wall for mounting the retrieval guide bars for the pump and manifold assembly. Installation of the baffle and reactor tubes is the next step, followed by connection of the disinfectant feed pipes. The use of this injection process in several municipal treatment plants is discussed. The method of disinfectant introduction is critical to the kill efficiency. The more time the disinfectant has to react with species in the water, the less is its toxicity. This method injects molecular chlorine (The most reactive and toxic chlorine species) directly into the turbulent field, dispersing the disinfectant throughout the entire effluent flow. For a very short period, bacteria and viruses are subjected to an acutely toxic environment. (Orr-FIRL)

A BREAKTHROUGH IN SEWAGE TREATMENT...AND THE MAKER'S VIEW.
Water, No 4, p 19, 1975.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, Energy conservation, Sludge, Economics, Costs, Biological treatment.
Identifiers: *Deep Shaft Process.

ICI's Agricultural Division has developed a revolutionary sewage process called the ICI Deep Shaft Effluent Treatment Process. A deep shaft partitioned into two sections and installed underground forms the basis of the process. Liquid effluent enters the shaft continuously and is circulated around the sections of the shaft repeatedly before overflowing by gravity for solids separation. Compressed air promotes biological oxidation and is the driving force for circulating the liquid effluent. The process should reduce future sewage works to half their normal size, operate them more cheaply, and produce only half of the normal amount of sludge. The process will also improve the environment by placing the major part of the treatment process underground and eliminating smell. The Deep Shaft process replaces the aeration and digestion stages of conventional sewage treatment processes. Considerable energy is saved by the exceptionally good use made of air's oxygen in the process. The depth of the shaft will determine the efficiency of the o ygen transfer. A deeper shaft will provide for mo efficient oxygen transfer. The depth and diame of the shaft will vary to meet the conditions of dividual treatment plants. The problem of sl treatment rates in cold climates would also reduced with the process. (Orr-FIRL)

ALUM VS. PHOSPHATE--WASTEWAT TREATMENT,
Allied Chemical Corp., Morristown, N. J. Indus al Chemical Div.
R. W. Ockershausen.
Water and Sewage Works, Vol 122, No 7, p 80- July, 1975. 2 tabs.

Descriptors: *Nutrient removal, *Coagulati *Waste water treatment, Activated sluc Suspended solids, Biochemical oxygen dema Phosphorus, Capital costs, Aluminum.
Identifiers: *Alum, *Phosphorus remo *Chemical treatment, Coagulants.

Chemical treatment of municipal waste wate discussed. Of the types of coagulants used remove phosphorus, alum is the most popu found in 135 out of the 300 cities in this stu Chemical doses vary, dependent upon the pH the water, colloids present and their electr charges, pollutant load by waste discharges fr industries, amount of groundwater infiltrati and temperature effects. Alum usage in activa sludge plants is compared with doses applie treatment of raw waste water, and to doses trickling filters. The lowest doses are needed in activated sludge plants due to several factors: is lower due to CO2 release, which fa phosphorus removal and coagulation; degree time of mixing can be controlled by moving point of chemical addition in the aeration stage maximum floc formation; and the recycle of tivated sludge containing aluminum values fro previous addition aids in phosphorus remo thus requiring less fresh chemical addit Besides removing phosphorus, clarification alum addition improves suspended solids BOD removals. Capital costs of chemical tr ment are low and operating costs are depen upon the price of the chemicals. (Kramer-FIRL

OZONE STIFLES SEWAGE ODORS IN SIDENTIAL AREAS,
New York City Dept. of Water Resources. St tural Section.
M. Baratt.
The American City, Vol 90, No 8, p 54, Aug 1975. 1 fig.

Descriptors: *Ozone, *Odor, Construction ma als, *Sewage treatment, *Waste water treatm Design criteria, Plastics, Treatment facilities, rosion control, New York.
Identifiers: Polyvinyl chloride, New Y City(NY).

The Manhattan grit chamber treatment fac handles up to 110 mgd raw sewage from se and storm drains from the upper East Side of York City. In the past, odorous air, contai hydrogen sulfide and other chemicals, discharged from the chamber and vented out roof. To eliminate the unwanted odors, treatr with ozone was chosen. Because the weight conventional ozone chamber of steel and conc would be too much for the existing building h ing the grit chamber, and because the steel concrete labyrinth would be too expensive, it necessary to choose another construction mat for the maze. A system of fiberglass-reinfo polyester structural members with corrug PVC panels was selected; structures of Ext were employed, having dual properties of c sion resistance and a high strength-to-weight r New blowers were installed to deliver 67,800

f untreated air per minute to the ozone chamber. lorizontally corrugated PVC panels were ex-ended from a light concrete plank floor up to the uilding roof and were arranged to form a 400 ft ng labyrinth for ozone contact. Ozone may be roduced on site at a rate of 17.5 lb/day and is ixed with polluted air with a 25 second contact me. Purified air is vented to the atmosphere rough a louvered port, eliminating the undesira-le odors to the city. (Kramer-FIRL)

lentifiers: Petrochemicals, Clarification.

he mechanisms and applications of polymers for ater and waste water treatment are discussed. he primary purpose of polymer use is to aid in quid/solid separation processes. Polymers may e used both as primary coagulants and as coagu-nt aids, and have as a function to provide more mplete separation, to increase hydraulic capaci-of operating equipment, or to reduce the mount of chemical solids. The solids separation echanism consists of coagulation, or charge eutralization and microfloc formation, and floc-ulation, or the physical agglomeration of the icrofloc and entrapment of suspended solids. olymers are long chain molecular structures, and ay be anionic or cationic. For use in water clarifi-ation, liquid cationic polymers are useful because ost naturally occuring solids suspended in water ossess anionic surface charges in aqueous spensions. The cationic polymers, by collision, onding, and physical forces, cause the particles coalesce to a size suitable for removal. Another pplication of polymers is in municipal pollution ontrol plants as a replacement for lime or ferric hloride in sludge dewatering. Polymers are also sed in other solids/liquids separation processes to d in primary and secondary clarification, in utriation, and in reduction of suspended solids in gester supernatant. For industrial wastes, olymers may be used for clarification, sedimenta-on, thickening, filtering, dissolved air flotation, nd centrifugation in the paper, petrochemical, ining, refining, and manufacturing industries. NEW LOOK AT SEWERAGE AND SEWAGE ISPOSAL.
hartered Municipal Engineer, Vol 102, No 6, p -59, June, 1975. 3 fig.

escriptors: *Sewerage, *Waste water treatment, Sewage disposal, *Sewage treatment, Storm ater, Overflows, Weirs, Industrial wastes, Tex-les, Oil wastes, Methane, Treatment facilities, umps, Equipment.

sues presented at a seminar on 'Modern prac-ces in sewerage and sewage disposal', held in irmingham, Great Britain, are discussed. Design iteria for a foul sewerage scheme were defined concept, capacity, hydraulic design, structural sign, and specification and construction. Storm wage overflow problems were considered, and commendations of a 6 DWF to be used for sign of sewers and the minimum setting of weirs overflow manholes were made. The discharge industrial wastes was also reviewed, including e more biodegradable wastes, such as those om tanneries, farms, and textile industries; the rong, potentially harmful wastes from phar-aceutical, plastics, and petrochemical industries, and the toxic wastes, from chemical, oil, and metal industries. Treatments for each type were recommended. Description of some developments in sewage treatment involved the selection of appropriate standards for treated effluents, needs for seasonal treatment, such as in holiday campsites, and modifications in existing treatment facilities. Recovery of energy as methane from sludge digestion plants was suggested. Also, various equipment, including vacuum and pressure pump tankers, comminuters, and several pumps were described in detail. NEW THERMAL PROCESS FOR PURIFYING WASTE WATERS.
Industrial Heating, Vol 42, No 7, p 32-34, July, 1975. 2 fig, 1 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Sewage treatment, Water reuse, Recycled water, Phosphates, Oil wastes, Organic compounds, Heat transfer, Conservation, Economics.
Identifiers: Zero discharge, *Heat treatment(Waste water), Thermopure process.

The Thermopure Process, developed at Laboratories of Aluminum Company of America (ALCOA), uses waste heat to purify industrial and sewage waste waters. Waste heat is used to concentrate waste products for reuse or simplified disposal and also produces deionized quality water that can be reused. A process description is given. The process employs conventional materials and established engineering technology and operated with low-pressure steam generated preferably by waste heat from various sources. Tests have been conducted using tap water, phosphate wastes, and a variety of oil wastes as feed materials. The thermal processing system is suitable for treating dilute salt wastes. Concentration of dilute acid or caustic wastes for reuse or sale is possible. Many types of oily wastes can be satisfactorily treated and can be reused after filtration. Dilute organic wastes are amenable to the process; the concentrated wastes can be reprocessed or incinerated. Advantages of the process include: production of deionized quality water; concentration of the original dilute waste to normal process levels makes reuse possible, and improves disposal, utilization of waste heat improves the economics of the process; the unit is suitable for unattended operation; and, based on the high quality water, reuse of concentrated waste, recovery of heat and elimination of high cost waste treatment, the process is most economical. The process can be used in a zero discharge system. (Orr-FIRL)

CANADA PIONEERS LARGE-SCALE OZONE PLANTS.
Design Engineering, Vol 21, No 8, p 29-31, August, 1975. 1 fig.

Descriptors: *Ozone, *Waste water treatment, *Odor, *Sewage treatment, Municipal wastes, *Canada, Treatment facilities, Computers, Control systems, Filtration, Chlorination, Viruses.
Identifiers: Toronto(Canada), Montreal(Que).

Two very large scale ozone-based facilities are under construction in Canada. These are the Ashbridge Bay odor-control plant in Toronto, and the Baillets filtration plant for water treatment in Montreal. In Ashbridge Bay, the primary odor source is sewage off-gases from the aeration tank. In order to oxidize these odorant gases, the tanks must be covered and ozone gas will then be introduced. Ozone will be generated, introduced into the chamber for contact, and monitored for proper dosage by an automatic control system which is adaptable to full computer control in the future. In the field of municipal water treatment the province of Quebec has already installed 21 ozone treatment facilities. By March 1976, the Baillets facility in Montreal will be the largest existing ozone-based water treatment plant. This facility will eventually treat 500 mgd to serve 88% of the Montreal urban population. The processes used will be filtration, ozonation, and chlorination; the ozone operation consists of pretreatment of the air, ozone generation, and ozone application. Ozonized air will be bubbled into the water at a depth of 24 feet and contacted for a sufficient time to produce an ozone residual of 0.4 mg/liter so that all bacteria and most viruses are destroyed. EXPERIMENTAL STUDIES ON MECHANISM OF FILTRATION IN A MULTILAYER FILTER, (IN JAPANESE),
O. Shinohara, and T. Ueda.
Journal of Japan Water Works Association, No 489, p 2-38, June, 1975. 63 fig, 9 tab, 8 ref.

Descriptors: *Filtration, *Reviews, *Turbidity, *Waste water treatment, Kinetics, Hydraulics, Filters, Head loss.
Identifiers: Japan, Multilayer filters.

A review is presented of studies of filtration using multilayer filters. Comparisons are given of headloss, turbidity of filtered water, load factor of headloss at each depth, and effective filtration time for various filter systems. The mechanisms of filtration for a multilayer filter, including the production of micro-flocs and growth-flocs, are discussed. A determination of optimum values for floc properties, layer composition, and filtration speed may be made. Factors governing effective time are also detailed. (Kramer-FIRL)

AUTOGENUS INCINERATION OF SEWAGE SLUDGE NOW POSSIBLE,
Komline-Sanderson, Ltd. Brampton, (Ontario).
A. Bowser.
Water and Pollution Control, Vol 113, No 7, p 17, 30-31, July, 1975. 3 fig, 1 tab.

Descriptors: *Dewatering, *Waste water treatment, *Sludge treatment, Incineration, Polymers, Flocculation, Sludge disposal, Activated sludge.
Identifiers: Autogenus incineration, Pulped newsprint, Vacuum filtration, Sludge conditioning, Waste activated sludge.

Experimental studies on sludge dewaterability to a level high enough in combustible solids to be autogenously incinerated have been conducted at Hamilton, Ontario. Criteria for a conditioning agent are that it: should be cheap and readily available; have a high heat value, so that final solids concentration required for autogenus incineration is reduced; be able to combine with sludge to allow the mixture to give up its water easily; and, that it should handle easily, without hazards. A material which met these requirements was waste newsprint, which is readily dewaterable in a two-stage process of vacuum dewatering, followed by squeezing in a mechanical rotary press to a high solids concentration. It was found that pulped newsprint could be used to dewater waste activated sludge. Sludge needed to be first flocculated with a polymer, then mixed with the newsprint. A two-stage operation consisted of vacuum filtration to a filter cake of 13 to 15%

LIBRARY U. OF I. URBANA-CHAMPAIGN

solids (950 BTU/lb) which was then mechanically squeezed to the final product of 25-30% solids (1780 BTU/lb). Filter yield and final solids concentration of the product depend upon the relative amount of newsprint pulp added to the flocculated waste activated sludge. Further laboratory tests showed that raw primary and digested sludges may be similarly dewatered. Ferric chloride and lime conditioning were compared to this proposed use of polymer and newsprint pulp and the latter were seen to produce a sludge with less ash and, a cleaner filtrate, which was more amenable to autogenous incineration. EVAPOTRANSPIRATION POSSIBLE NEW SEWAGE TREATMENT PROCESS.
Journal of Environmental Health, Vol 37, No 5, p 476-477, March-April, 1975. 14 ref.

Descriptors: *Sewage treatment, *Evapotranspiration, Canada, Aerobic conditions, Microorganisms, Land management, *Waste water treatment, *Waste disposal.
Identifiers: On-site disposal.

The use of evapotranspiration for treatment of sewage is discussed. Studies have been conducted in Ontario on the disposal of waste water by infiltration into the soil, whereby foliage of plants takes up water from the soil and it is evaporated into the air. By installing a shallow aerobic seepage bed and planting on top, plants use the wastes as food and water and aerobic microorganisms promote evaporation. In this on-site disposal method, uptake of nutrients by plants occur in the upper four to five feet of soil, and 95 to 97 percent of all pollutants and nutrients should be removed. For an evapotranspiration system (transvap), proper land management is necessary. To ease the load on the system: the ground surface above the bed should arch upward, promoting precipitation runoff; drainage and diversion trenches and grading should be utilized to shield the system from runoff; and shrubs and trees may be planted around the soil absorption area to add to the evapotranspiration capacity. (Kramer-FIRL)

EFFECT OF MEDIA INTERMIXING ON DUAL MEDIA FILTRATION,
Iowa State Univ., Ames. Dept. of Civil Engineering.
J. L. Cleasby, and G. D. Sejkora.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 101, No EE4, p 503-516, August, 1975.

Descriptors: *Waste water treatment, *Water treatment, *Filtration, *Filters, Coals, Sands, Interfaces, Mixing, Efficiencies, Water quality.
Identifiers: *Dual media filters, Media intermixing, Anthracite coal, Silica sand.

Dual media filters composed of anthracite coal over silica sand are widely used in water and waste water treatment. A study was performed to determine if intermixing at the interface of the mediums has any effect on the performance of dual media filters. Performance differences were shown by measurements of headloss development and effluent quality versus time during filtration. Interfacial intermixing did not affect filter performance as measured by both headloss development and effluent quality of dual media filters. The mixed interface filter media produced a higher quality filtrate than did the sharp interface filter media. This was due to substantially finer sand in the mixed interface media. The mixed interface filter media produced higher headlosses than the sharp interface filter media because of the greater suspended solids removal. Intermixing at the interface of dual media filters is unavoidable. It occurs when current media materials are used and sizes are selected to achieve coarse to fine filter media in the direction of flow. A reasonable amount of interfacial intermixing is desirable in dual and multimedia filters to achieve a better quality filtrate. (Orr-FIRL)

WASTEWATER TREATMENT DESIGN: ECONOMICS AND TECHNIQUES, PART I,
Vanderbilt Univ., Nashville, Tenn.
W. W. Eckenfelder, Jr.
Water and Sewage Works, Vol 122, No 6, p 63-65, June, 1975. 6 fig, 2 tab.

Descriptors: *Waste water treatment, *Domestic wastes, *Industrial wastes, Activated sludge, Biological treatment, Biochemical oxygen demand, Temperature, Organic loading, Kinetics, Suspended solids, Biodegradation, Costs.

Specific waste water treatment design considerations are needed in order to economically meet the effluent limitations required by PL 92-500. The effluent quality from a waste water treatment facility will be related to the characteristics of the raw effluent and to the processes used in treatment. There are distinct and major differences between an industrial waste water and domestic sewage. In the treatment of domestic sewage by activated sludge, the colloidal and suspended BOD is bioflocculated and rapidly removed by a physical-chemical mechanism, while the soluble BOD is extracted slowly by a biochemical mechanism. Soluble industrial waste water requires biological BOD removal which is a function of time and concentration. A recently proposed kinetic model defines the performance of activated sludge treating variable strength soluble organic waste waters in terms of influent BOD, soluble effluent BOD, aeration volatile suspended solids, and aeration retention time. The implication of the model is that at a constant organic loading (F/M), the effluent soluble BOD is directly proportional to the influent BOD. Temperature affects the performance of the biological process, since the biodegradation rate is temperature dependent. The important temperature is the temperature in the aeration basin. A thermal balance must be figured considering the ambient air temperature and the influent waste water temperature. To determine the total BOD in the effluent, the contribution from the effluent by suspended solids must be added to the soluble BOD. Increasing the total dissolved solids in the waste water will generally result in an increase in effluent suspended solids. (See also W76-00225) (Orr-FIRL)
W76-00224

WASTEWATER TREATMENT DESIGN, PART II,
Vanderbilt Univ., Nashville, Tenn.
W. W. Echenfelder, Jr.
Water and Sewage Works, Vol 122, No 7, p 70, 75, July, 1975. 2 fig, 1 tab, 3 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Domestic wastes, Design, Biological treatment, Water quality control, Pre-treatment, Coagulation, Activated carbon, Activated sludge, Biochemical oxygen demand, Chemical oxygen demand.
Identifiers: *Physico-chemical treatment.

Increasingly strict water quality standards require combinations of biological, physical and chemical treatment processes. Physical-chemical processes may be used for independent physical-chemical treatment of domestic sewage and certain industrial waste waters or for tertiary treatment following biological treatment processes. Physical-chemical treatment, consisting of pretreatment, chemical coagulation employing lime, iron salts or alum f lowed by granular carbon columns, is highly effe tive for the treatment of domestic sewage. T treatment of industrial waste waters contain high concentrations of soluble organics crea several problems in physical-chemical treatme These can most effectively be treated by a co bination of biological, physical and chemi processes. A number of possible process combi tions are discussed; these may include the addit of powdered carbon to the activated slu process or the use of mixed media filters. Vari process combinations that might be used achieve high quality effluents are presented. T main parameters considered in the combinati include: the BOD removal rate coefficient, k; COD to BOD ratio; and, the total dissolved so in the waste water. When the BOD reaction r coefficient, k, is very low, very long aerat times are required to reduce the soluble BOD levels of 10 mg/liter or less. Cost relationships terms of k and soluble effluent BOD, are gra cally portrayed. Temperature has an important fect on the performance of biological waste wa treatment processes. PARTICLES, POLYMERS, AND PI FORMANCE IN FILTRATION,
Quanta Consulting Engineers, Tehran, Iran.
M. R. Habibian, and C. R. O'Melia.
Journal of the Environmental Engineering D sion, Proceedings of ASCE, Vol 101, No EE4 567-583, August, 1975. 9 fig, 2 tab, 24 ref, 2 pend.

Descriptors: *Filtration, *Laboratory te *Waste water treatment, *Water treatme Polymers, Coagulation, Separation techniqu Packed beds, Particles.

The results of laboratory experiments concer with the effects of polymers on the removal of ticles from aqueous suspensions by packed- filters are discussed. The rationale for develop and interpreting the experiments is that coag tion and filtration are quite similar proces Based on results using cationic polymers for filtration of latex suspensions and trickling f effluent, it is concluded that the chemical de bilization necessary for effective filtration similar to that required for effective coagulat Chemicals which are effective in coagulation also effective in filtration. The optimum dose destabilizing chemical in filtration is the sam the optimum dose in coagulation. Standard (coagulation) tests can be used to determine type and amount of chemical needed for de bilization in filtration. Overdosing stoichiometry occur in polymer-aided filtratio well as in polymeric coagulation. The optim polymer dosage was independent of the molec weight of the cationic polymer series te (polyethylenimenes), except for the lo polymer in the series. The removal efficienc filters operated at the optimum dosage increa with increasing molecular weight of the poly employed. For a properly conditioned filter, filter efficiency is independent of the concen tion of suspended materials in the influent. makes the direct filtration of low-turbidity w technologically feasible. The head loss with filter bed varies inversely with the size of the p cles removed from the suspension. (Orr-FIRL)

IRRADIATION OF SEWAGE GAINS D HERENTS,
D. A. O'Sullivan.
Chemical and Engineering News, Vol 53, No 30-31, August 25, 1975.

Descriptors: *Waste water treatm *Irradiation, Gamma rays, Radioisotopes, C radioisotopes, Cesium, *Sewage treatment, Ir

tion, Fertilization, Sewage disposal, Radioactive wastes, *Pilot plants, Treatment facilities.
Identifiers: Electron beam irradiation.

The progress of the use of irradiation for sewage and waste water treatment is discussed. A pilot plant is being installed at Boston's (Mass) Deer Island sewage treatment plant to test the effectiveness of electron beam irradiation in treating municipal sewage. A pilot system is being planned for Fort Belvoir, Va. Tests will examine the feasibility of replacing the secondary treatment with irradiation and will evaluate the use of the resulting sludge as fertilizer. The pilot will use cobalt-60 and then switch to cesium-137 when it becomes more widely available as a waste product from nuclear power plants. Cesium-137 is the preferred radioisotope being studied at Sandia Laboratories in Albuquerque, N.M. Engineers at International Purification Systems Inc., in Atlanta, Ga., are working on a waste water purification system that uses gamma irradiation to regenerate a charcoal adsorbent bed continually. A new treatment system for Monticello, Fla., will involve irradiation to pasteurize waste water from the sewage works so that is can be used safely for irrigation. Engineers at Aqueonic Inc., in Los Altos, Calif., have developed the Biochemrad system which combines primary, secondary, and tertiary sewage treatment in a multistage design. The first commercial sewage irradiation operation started in West Germany in 1973. Currently it is questioned as to whether radioactive isotopes or high energy electron beams are the preferred method of sewage purification. The reasons for either choice are discussed. (Orr-FIRL)

STUDIES ON THE METALLIC ION STIMULATION AND TOXICITY IN SLUDGE DIGESTION,
Dorr-Oliver (India) Ltd., Madras.
K. N. Savalappan.
Journal of the Institution of Engineers (India), Vol 55, Part PH 2, p 51-54, February, 1975. 12 ref.

Descriptors: *Waste water treatment, *Sludge treatment, *Sludge digestion, *Anaerobic digestion, Metals, Sewage sludge, Bacteria, Anaerobic bacteria, Biological treatment, Nutrients, Toxicity, Methane bacteria.

Anaerobic sludge digestion is the anaerobic decomposition of putrescible matter accompanied by gasification, liquefaction, stabilization, and destruction of colloidal structure. The purposes of sludge digestion include: altering the water binding characteristics so that rapid dewatering will result; reducing the initial bulk for economical solids handling; destroying pathogenic organisms for health protection; stabilizing a sufficient fraction of the organic solids so that noxious odors are not produced; and, recovering the methane gas and digested sludge as usable by-products. The three important factors in the process of sludge digestion are the digestion tank, the sewage sludge, and the bacteria. After the sludge is sent to the digestion tank, the organic materials, contained mostly in the solid portion of the sludge, are slowly hydrolized and brought into solution by the bacteria and the enzymes present in the sewage sludge. The importance of enzymes in digestion was discussed. The nutritional requirements of the sewage bacteria were also discussed. An organism in general requires: a source of nitrogen; a source of carbon; inorganic salts; and, a source of energy. It can be assumed that a bacterium will not grow well in the complete absence of all mineral elements. The function of metal ions in bacterial nutrition is similar to the role played by vitamins in human nutrition. The study of the effects of various cations on sludge digestion is extremely important. Stimulation was defined as an increase in the biochemical activity of bacteria over the normal activity due to the addition of any substance. Toxicity or inhibition was a decrease in the biochemical activity. (Orr-FIRL)

ULTRA-HIGH RATE FILTRATION PROBLEMS,
Technical Univ. of Budapest (Hungary).
I. Horvath.
Journal of the American Water Works Association, Vol 67, No 8, p 452-453, August, 1975. 3 fig, 1 tab, 3 ref, 1 append.

Descriptors: *Water treatment, *Filtration, *Hydraulic gradient, Darcys law, Mathematical models, Flow rate, Fluid mechanics, Hydraulic models.
Identifiers: Kozeny-Carman relationships, *High-rate filtration.

The Darcy formula for calculating filtration rate based on hydraulic gradient and the related Kozeny-Carman relationships are not applicable for conditions with a Reynold's number greater than four. Kozeny-Carman equations only apply to the rate range of practical filtration where the rate of filtration is less than 20-25 m/hr. New relationships between rate of filtration and hydraulic gradient have been determined for streamflow conditions within high-rate and filters typical of water treatment plants. The relationship was derived on the basis of analogies between the hydraulic process in porous media and physical analogies based upon Fourier's law, Maxwell's law, and Ohm's law and also an analogy based on transfer streams. The equations represent a hyperbolic relationship between rate of filtration and hydraulic gradient, the controlling factors of which are v sub max, the theoretical maximum value of rate of filtration in meters per hour and I sub sz, a parameter to be determined experimentally, having the character of a hydraulic gradient. These two factors include the influence of all geometrical and physical factors, such as grain size, void ratio, viscosity, density, and temperature, which have a role in the given filtration process. If the hydraulic gradient is much smaller than I sub sz, then the relationships simplify to the Darcy formula. The validity of the derived relationships was verified by experimental proofs from the literature and from the author's experiments. More research is needed to determine a more detailed hydraulic interpretation of the parameters v sub max and I sub sz. (Orr-FIRL)

AEROBIC DIGESTION AND EVAPOTRANSPIRATION IN HOME DISPOSAL SYSTEMS,
S. J. Dea.
Water and Sewage Works, Reference Number, p R76-80, R82, April 30, 1975. 4 fig, 7 ref.

Descriptors: *Waste water treatment, *Waste water disposal, *Domestic wastes, Septic tanks, Design criteria, Evapotranspiration, Plant populations, Percolation, Biological treatment.
Identifiers: *Home disposal systems.

A unique waste water treatment and disposal system for an individual dwelling or home usage is described. The system can be used as an alternate to standard septic tanks which are unsuitable for many soil and geological conditions. The system design includes batch extended aeration, an elevated-mound disposal field and evapotranspiration using native or planted vegetation. The following engineering criteria were used to formulate the system design: the infiltrative surface should be no less permeable than any undisturbed parallel plant within the system; the soil surface should be managed so as to disperse clogging material; there should be no abrupt change in particle size between trench fill or surface cover material and soil at the infiltrative surface; continuous flooding of the infiltrative surface must be avoided; aerobic conditions should be maintained in the soil system; the entire infiltrative surface should be loaded uniformly and simultaneously; and, the amount of suspended solids and nutrients in the applied water should be minimized. Brief descriptions and basic justifications are presented for each of the three distinct component parts of the waste treatment and disposal system: biological treament-batch extended aeration; effluent distribution and percolation; and, soil treatment and evapotranspiration. A cost analysis is given for a three-bedroom home in the Philadelphia, Pennsylvania, suburbs. (Orr-FIRL)

THE ROLE OF MIXING IN EQUALIZATION,
Mixing Equipment Co., Rochester, N.Y.
P. R. Bradley, and J. Y. Oldshue.
Water and Sewage Works, Reference Number, p R173-R177, April 30, 1975. 5 fig, 3 tab.

Descriptors: *Waste water treatment, *Equalizing reservoirs, *Mixing, Equipment, Flow control, Waste dilution, Circulation.
Identifiers: *Equalization basins, Flow fluctuations, Concentration fluctuations.

Proper selection of equalization basin volumes and mixing equipment can reduce the investment and operating costs for physical, chemical, and biological treatment systems, and can produce a system that is less susceptible to upsets and that will consistently provide a better quality effluent than an unequalized system. The hydraulic equalization basin is characterized by a varying flow into the basin and a constant flow from the basin and will dampen out fluctuations in influent stream concentration and flow. The second type of equalization basin contains a constant volume and will only dampen fluctuations in concentration. The most typical type of waste stream is one in which both flow and concentration vary. Equalization of these streams can be effected by either fixed or varying volumes in the equalization basin. Proper installation and baffling of the fluid agitation equipment used to provide mixing in the system is critical to the successful operation of an equalization system. Blending in waste treatment is a flow controlled operation which means that large diameter impellers running at slow speeds require less horesepower for the same degree of blending than do small high speed impellers. For a mixing to operate properly a well baffled system is required in order to make maximum use of the applied power. Correct baffling ensures a uniform fluid regime and provides for a constant and uniform power draw. (Orr-FIRL)

PILOT-SCALE, HIGH-RATE BIOLOGICAL DENITRIFICATION,
Ecolotrol, Inc., Bethpage, N.Y.
J. S. Jeris, and R. W. Owens.
Journal Water Pollution Control Federation, Vol 47, No 8, p 2043-2057, August, 1975. 14 fig, 5 tab, 4 ref.

Descriptors: *Waste water treatment, *Denitrification, Nitrification, Municipal wastes, Nitrogen, Recharge, Groundwater, Water pollution control, *Pilot plants, New York, Treatment facilities, Water reuse.
Identifiers: *Fluidized bed reactor, Nassau County(NY).

A pilot scale fluidized bed reactor was installed at the Bay Park Water Renovation Plant, Nassau County, New York, to denitrify the waste water before disposal of the waste water into the groundwater table. The reactor consisted of five 0.6-cm thick Plexiglas sections 0.46-m in diameter. A 0.3-cm thick steel flow distribution plate was positioned 0.46-m up from the base of the column and covered with 3.8-cm of pea gravel and about one m or 270 kg of white silca sand with an effective size of 0.6-mm and a uniformity coefficient of 1.5. A schematic diagram of the nitrification and denitrification processes is presented. High-rate denitrification in a fluidized bed of sand covered with denitrifying biomass was successfully demonstrated at this moderate sized pilot plant treating 136,000 liters/day. The system consistently produced greater than 99% removal of

LIBRARY U. OF I. URBANA

the influent nitrogen in less than 6.5 minutes at a flux rate of 620 liters/min/sq m. The full potential of this system has not yet been determined. The average removal was 5,450 kg. of NO3-N/day/cu m of reactor volume but the system was also able to remove up to 20,700 kg/day/cu m. Nitrogen removal efficiency was not affected by diurnal flow variation and a 17-hour shutdown. The operation routine was simple, trouble-free, and required little time. The removal ability was greater than the concentrations of nitrate-nitrogen that would be expected in a municipal treatment plant. The proven efficiency of this system as well as its low space requirements and ease of operation should make it a viable denitrification alternative method. (Orr-FIRL)

ACTIVATED CARBON: OLD SOLUTION TO OLD PROBLEM, PART I,
ICI United States Inc., Wilmington, Del. Specialty Chemicals Div.
A. D. Adams.
Water and Sewage Works, Vol 122, No 8, p 46-48, August, 1975. 2 fig.

Descriptors: *Waste water treatment, *Activated carbon, Lignite, Sludge treatment, Methane, Sludge digestion, Filtration, Trickling filters, Anaerobic digestion.
Identifiers: Powdered activated carbon.

Laboratory and full scale field trials, conducted from 1972-1974, have shown that the addition of powdered lignite activated carbon to anaerobic digesters will minimize operating problems and lower sludge disposal costs. In the laboratory test, municipal sludge was digested in a batch treatment process and gas evolution was measured. After three weeks, methane production in the digester dosed with lignite carbon was five times that of the control. The first field evaluation was performed at a two mgd trickling filter plant using two stage digestion. Powered activated carbon was added to the primary sludge and supernatant clarity and gas production were monitored. After two weeks, the supernatant clarity had improved measurably, the vacuum filter operation had improved, and the necessity for the use of FeCl3 and lime had decreased. However, the expected increase in gas production did not occur, possibly due to the presence of industrial wastes. Activated carbon was then added to the sludge in a two stage digestion system of a 1.8 mgd trickling filter plant. Clarity of the supernatant improved and gas production increased from an average of 7500 cu ft/day to 11,000 cu ft/day. The third evaluation was performed at a two mgd activated sludge plant with a severely overloaded two stage digestion system. The supernatant improved, gas production increased, and use of vacuum filtration was no longer necessary as a result of the addition of activated carbon. (Orr-FIRL)

UPGRADING LAGOON EFFLUENT FOR BEST PRACTICABLE TREATMENT,
Brown and Caldwell, Walnut Creek, California.
R. W. Stone, D. S. Parker, and J. A. Cotteral.
Journal Water Polltion Control Federation, Vol 47, No 8, p 2019-2042, August, 1975. 16 fig, 9 tab, 11 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, Water quality standards, Flotation, Filtration, Nitrification, Chlorination, Algae, Bays, California, *Sewage lagoons, Oxidation lagoons, Pilot plants.
Identifiers: Dissolved air flocation, Gravity filtration, Breakpoint chlorination, *Fixed bed reactors, San Francisco Bay(Calif).

Modeling efforts and studies performed by the University of California's Sanitary Engineering Research Laboratory of Berkeley, state and federal agencies, and engineering consultants have detetermined that the water pollution problems associated with the South Bay segment of the San Francisco Bay system may be mitigated by appropriate control measures such as upgrading existing treatment facilities to a level of quality higher than that defined by federal secondary treatment standards. The potentially feasible alternatives for upgrading the Sunnyvale, California, treatment plant were identified. The apparent best alternative project was determined to be to add fixed growth reactors for nitrification and dissolved air flotation and gravity filtration for alga removal and dechlorination. Pilot plant studies of the tertiary treatment processes identified in the apparent best alternative project were started in spring 1973. Studies were performed on dissolved air flotation, filtration, breakpoint chlorination, and nitrification using fixed growth reactors. Maximum allowable loading rates, chemical requirements, and operational parameters were evaluated for each of the unit processes. A schematic drawing of existing and proposed facilities is presented. Descriptors: *Waste water treatment, *Sewers, *Overflow, *Combined sewers, *Treatment facilities, Sewerage, Biochemical oxygen demand, Suspended solids, Effluents, Organic matter, Lagoons, Data collections, Hydraulics, Storm runoff.
Identifiers: Wet weather discharge, Organic loading.

Three systems for the treatment of combined sewer overflow in Shelbyville, Illinois, were evaluated for influent and effluent flow, BOD, and suspended solids. These were a single-cell flow-through lagoon, a retention lagoon followed by a two-cell facultative lagoon system and effluent chlorination, and a sedimentation tank with influent chlorination. Each alternative unit was found to be effective in reducing the measured pollutional discharges during wet weather conditions. Partial separation of the combined sewers also was successful in reducing the organic loading during periods of combined sewer overflow. A detailed analysis was presented of the two-cell facultative lagoon as a tertiary treatment system for the existing sewage treatment plant effluent. Data on the operation of the units was collected only during April and May, and it was recommended that these treatment units be further tested for seasonal variation in runoff which might affect unit performance. Design criteria in selecting and sizing combined sewer overflow treatment units should be based on the expected first flush characteristics, runoff intensities, and influent sewer hydraulic capacities. A PILOT PLANT FOR SEWAGE TREATME BY CROSS-FLOW FILTRATION,
Tennessee Univ., Knoxville. Dept. of Chem Engineering.
J. J. Perona, J. D. Hutchins, A. M. Rom, J. S. Johnson, Jr., and W. G. Sisson.
Available from the National Technical Infor tion Service, Springfield, Va 22161, as ORI TM-4659, $4.25 in paper copy, $2.25 in microfi Oak Ridge National Laboratory, Tennessee, port No ORNL-TM-4659, September, 1974. 20 fig, 1 tab, 1 ref.

Descriptors: *Sewage treatment, *Pilot pla *Waste water treatment, *Treatment facili Municipal wastes, Alkalinity, Filtration, Filt Effluents.
Identifiers: Cross-flow, filtration, Physico-ch cal treatment.

The first six months of operation of a 10,000 pilot plant for treating primary sewage effl from the Oak Ridge municipal plant have successful. The plant operates by physico-ch cal treatment, without biological action, an based on the cross-flow filtration process. process consists of acidification to pH 3 and a tion of iron; holdup with air sparging for one h pH adjustment to 6; and filtration. Five runs made with product fluxes above 100 gal/day for the first 50 hours of operation. Chemical power costs for a large scale process would

ıe range of 35 to 60 cents/gal. Effluent was taken om a primary settler as feed and produced a fil- ate of a higher quality than that obtained by econdary biological treatment. Because the resent filter design would not be applicable for rge scale plant, it is recommended that a filter evelopment program be conducted to implement is method. (Kramer-FIRL)

LABORATORY STUDY OF RDX ADSORP-ION BY CARBON,
rmy Mobility Equipment Research and Develop-ent Center, Fort Belvoir, Va.
G. Vlahakis.
vailable from the National Technical Informa-on Service, Springfield, Va, as AD/A-002 049, 3.75 in paper copy, $2.25 in microfiche. August, 974. 37 p, 18 fig, 4 tab, 2 append.

escriptors: *Waste water treatment, *Water eatment, *Adsorption, *Carbon, Activated car-on, Groundwater, Explosives, Potable water, everse osmosis, Ion exchange, Hydrolysis, hlorination, Polymers, Boiling.
lentifiers: *RDX, TNT, Filtrasorb 400.

two-phase study was performed to investigate eatment methods for the removal of RDX explo-ve (C3H606N6) from contaminated groundwater. he first phase of the program consisted of testing even different commercially available processes: arbon adsorption; reverse osmosis; ion exchange; ydrolysis; boiling; chlorination; and, polymeric dsorption. Carbon adsorption represented the est process for removal of RDX from potable ater based on relative simplicity and effective-ess for domestic use. Adsorption isotherm tests dicate that the maximum theoretical saturation apacity of Filtrasorb 400 is about 0.125 g RDX/g arbon for a feed concentration of 19.5 mg/liter DX. When about 60 mg/liter TNT were added to ıe RDX feed, the RDX saturation capacity was educed 40% to 0.076 g RDX/g carbon. The second hase of the investigation consisted of running mall-diameter-column exhaustion tests using Fil-asorb 400 to determine residence times, carbon apacities, and breakthrough characteristics of the arbon under dynamic conditions. Retention times f 0.92 to 4.90 minutes were studied. For five runs ith flow rates ranging from 0.36 to 1.5 gal/min/sq and feed concentrations from 5.5 to 20.4 mg/liter DX, the adsorption efficiency was directly re-ted to retention time. In competitive adsorption f TNT and RDX, the RDX adsorption efficiency as dependent on the RDX to TNT concentration atio over a narrow RDX concentration range. his is due to the preferential adsorption of TNT. dditional research should be performed to in-estigate a wider range of the experimental arameters in order to facilitate scale-up. NTERIM REPORT ON TASK FORCE ON HOSPHATE REMOVAL SLUDGES,
nvironmental Protection Agency, Cincinnati, hio. Advanced Waste Treatment Research Lab.
B. Farrell.
vailable from the National Technical Informa-on Service, Springfield, Va 22161, as PB-238 317, 7.25 in paper copy, $2.25 in microfiche. EPA Re-ort, EPA-670/2-75-013, January, 1975. 200 p, 1 g, 2 tab, 15 ref, 10 append. EPA Program Ele-ent 1BB043.

escriptors: *Waste water treatment, *Sludge eatment, *Sludge disposal, *Dewatering, Filtration, Phosphorus, Phosphates, Iron, Alu-inum, Lime, Solid wastes.
lentifiers: Sludge volume, Thickening.

substantial portion of waste water treatment apital and operating cost is due to sludge handling nd disposal. However, information on sludge roduced in conventional waste water treatment is widely scattered and very little information is available on the sludges produced by processes for phosphorus removal. An interim report of a task force on the sludges produced when lime, Fe(+++), or Al(+++) are added for the purpose of P removal is discussed. Most of the information concerns the mass of sludge produced and its filtering properties. The sludges formed when lime is added to waste water have a greater solids content after settling and dewater at greater mass rates than conventional sludges. Conventional sludges are defined as digested total sludge from a conventional primary plus activated sludge plant. Lime sludges produce a much larger mass of sludge per volume of waste water. Sludges formed when Al(+++) or Fe(+++) are added to waste water dewater more poorly than conventional sludges and the sludge solids content is less. The sludge mass produced is higher than that from conventional sludge but lower than that from lime sludges. Sufficient information is not yet available to accurately predict the dewatering properties of iron or aluminum sludges. Research studies and field investigations of the dewatering properties of iron and aluminum sludges are being continued. (Orr-FIRL)

UPGRADING AND EXPANSION OF THE WSCC PISCATAWAY WASTEWATER TREATMENT FACILITY TO 30 MGD AWT, PRINCE GEORGE'S COUNTY, MARYLAND, FINAL ENVIRONMENTAL IMPACT STATEMENT.
Environmental Protection Agency, Philadelphia, Pa. Region III.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-237 482, $19.25 in paper copy, $2.25 in microfiche. September 16, 1974. 824 p, 23 fig, 25 tab, 12 photos, 11 append.

Descriptors: *Waste water treatment, *Treatment facilities, *Environmental effects, Incineration, Environmental control, Environmental engineering, Maryland.
Identifiers: *Environmental impact statements, *Piscataway Wastewater Treatment Facility(Md), Prince George's County(Md).

The Washington Surbuban Sanitary Commission (WSSC) has applied to the Environmental Protection Agency for federal financial assistance to upgrade the Piscataway Wastewater Treatment Facility to provide advanced waste water treatment (AWT) and to operate at its full 30 mgd capacity. The final environmental impact statement report is presented. The proposed project is an integral portion of a comprehensive program designed to clean up the lower Potomac River and its tributaries. This project would improve water quality in the tributaries to Piscataway Bay. The facility will fulfill the goals of water pollution control without significantly harming other environmental criteria, and will aid in providing a cleaner, healthier environment. The adverse environmental impacts created by the implementation of this program are largely short-term and within acceptable limits. The adverse impacts are associated with construction activities and would result in temporary increased noise levels, disruption of traffic, inconveniences to residents, siltration of streams, disruption to wildlife and wildlife habitat, and slight decreases in ambient air quality in areas close to the construction. The size of the effluent disposal pipe and the proposed method of sludge treatment and disposal are two areas of controversy. The disposal pipe has a larger capactiy than is currently required but this is allowable because it eliminates the necessity for replacing the pipe if the capacity of the plant is increased in the future. The proposed method of disposal, incineration, is still under investigation. Incineration will not be allowed on a routine basis until its environmental effects are known. (Orr-FIRL)

ELECTROCHEMICAL CARBON REGENERATION,
Environics, Inc. Huntington Beach, Calif.
P. H. Owen, and J. P. Barry.
Avialable from the National Technical Information Service, Springfield, Va 22161, as PB-239 156, $3.75 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-670/2-75-028, June, 1972. 43 p, 10 fig. EPA Project 17020 HAL, 68-01-0040.

Descriptors: *Adsorption, *Activated carbon, *Waste water treatment, Municipal wastes, Effluents, Tertiary treatment, Electrochemistry, Water purification, Chemical oxygen demand, Costs, Sewage treatment.
Identifiers: *Electrochemical regeneration, Thermal regeneration, Regenerated carbons.

Experimentation was conducted to investigate a process of electrochemical regeneration of granulated activated carbon spent in the adsorption treatment of municipal secondary effluent. Electrochemically regenerated carbon and virgin carbon were compared by their respective abilities to remove soluble COD organics from sand-filtered secondary effluents during simultaneous dynamic exhaustion. It was found that electrochemical regeneration of granular activated carbon can restore the working capacity for removing soluble COD organics to from 42 to 61% of the capacity of virgin carbon. The 61% of COD capacity electrochemically regenerated is about 77% as good as the average thermal regenerated capacity. As compared to thermal regeneration of carbon, the costs of electrochemical regeneration are much lower. Based on the electrolysis cell energy requirement measured as 15.3 watt hours per gram COD adsorption capacity regenerated, the calculated cost of electrical power to regenerate and rinse the carbon spent in treating 1000 gallons of Lake Tahoe-type waste water was 0.66 cents. This is equivalent to 3.2 cents per pound of carbon at a dosage of 207 lbs carbon per million gallons of effluent. (Kramer-FIRL)

SLUDGE ACTIVITY AND FULL-SCALE PLANT CONTROL,
University of Strathclyde, Glasgow (Scotland). Dept. of Civil Engineering.
P. Coakley, and J. O'Neill.
Water Pollution Control, Vol 74, No 4, p 404-414, 1975. 8 fig, 2 tab, 15 ref, 1 append.

Descriptors: *Activated sludge, *Treatment facilities, *Control systems, Toxicity, *Waste water treatment, Automation, Monitoring, Biological treatment, Biochemical oxygen demand, Analytical techniques, *Sludge treatment.
Identifiers: Dehydrogenase activity, Sludge activity measurement, Triphenyl tetrazolium chloride (TTC).

Three recognized processes in activated sludge treatment are adsorption, flocculation, and biological oxidation. Discussion was given to the mechanism of the initial rapid removal of BOD, with emphasis on microbiological activity. Full-scale activated sludge plant studies indicated a significant increase in the level of dehydrogenase activity, as seen by the production of formazan, as the organic load to the sludge increased. A threefold increase in formazan yield was found to occur within 30 minutes of the addition. Toxic materials in the plant had a major role in the reduction of dehydrogenase activity. These may be measured by a dye such as triphenyl tetrazolium chloride (TTC), which gives early warning of toxic substances not normally monitored. From both full-scale plant and laboratory tests sludge activity measurements (expressed as yield of formazan from TTC/unit weight MLVSS) were shown to have potential for use in activated sludge plant control. Using graphs and tables compiled from plant data for formazan yield under a variety of conditions, a facility operator could assess: the

LIBRARY U. OF I. URBANA-CHAMPAIGN

ability of an activated sludge to metabolize a particular industrial effluent; whether sludge was underloaded or overloaded; and whether the sludge was affected by a toxic material. It is suggested that many sewage works are equipped to implement this control system, and that the method could be developed for automatic analysis. (Kramer-FIRL)

TREATMENT TRIO TAMES ORGANICS, KILLS BACTERIA.
Chemical Engineering, Vol 82, No 17, p 63, August 18, 1975. 1 fig.

Descriptors: *Waste water treatment, *Ozone, *Activated carbon, Pilot plants, Gamma rays, Treatment facilities, Disinfection, Oxygenation, Organic matter, Operating costs, Bacteria, *Bactericides, *Organic wastes.
Identifiers: Cobalt-60.

An alternative to chlorine disinfection of waste water has been tested, using a combination of gamma rays, ozone, and activated carbon. Compressed air is utilized to agitate waste water in an oxygenation chamber; ozone is then injected in the waste water from the bottom of the chamber. This raises the dissolved oxygen level to about 25 mg/liter, which is necessary to oxidize the organics completely to carbon dioxide and water. Waste water is then pumped from the oxygenation tank to an irradiator/activated carbon hybrid which is filled with activated carbon and has cobalt-60 rods in the center of a column. When organics attach to the column and are irradiated, the dissolved oxygen content drops to two to three mg/liter and color is reduced by 90 to 99%. Ozone is then injected into the discharge line, raising the dissolved oxygen level to about 14 mg/liter. While gamma rays alone kill 99% of viruses and bacteria and ozonization alone kills 95-96%, the synergistic effects of the combination remove practically 100%. A pilot plant has been operated at a 5000 gallons/day poultry processing facility in Marietta, Georgia. Even with influents containing 1150 mg/liter organics, the organics loading has been reduced by 95%. Because the radiation dose concentrates on the organics rather than the whole waste water stream, operating efficiency is higher and costs are lower. (Kramer-FIRL)

HOW TO DESIGN ACTIVATED SLUDGE UNITS,
Fluor Engineers and Constructors, Inc., Los Angeles, Calif. Environmental Engineering Dept.
S. J. Thomson.
Hydrocarbon Processing, Vol 54, No 8, p 99-102, August, 1975. 5 fig, 6 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Treatment facilities, *Design criteria, Industrial wastes, Biodegradation, Sludge, Microorganisms, Temperature, Organic compounds, Nutrients, Oil wastes.
Identifiers: Refineries, Petrochemical industry.

Activated sludge units for treatment of biodegradable substances need to be designed with considerable flexibility because the values of some operation parameters cannot be exactly determined. The consumption of biodegradable materials in aerated activated sludge systems varies with temperature, population of microorganisms, nutrient availability, oxygen supply, and type and concentration of organics in the feed. The design procedure described was developed using pilot and industrial operating data for activated sludge plants in the refining and petrochemical industry but similar design relationships can be determined for the design of units for other industries by similar collection and evaluation of appropriate data. Graphs are presented which show the following operating data: residence time; sludge production; sludge age; and oxygen requirement. Interpretation of the graphs is demonstrated by a sample problem. The steps in the procedure are to: establish the required food to microorganism ratio; determine the required aeration basin volume for a MLVSS concentration of 2,500 mg/liter; calculate the aeration residence time; establish sludge production; check sludge age; establish oxygen requirement; determine design return activated sludge flow; calculate nutrient requirements; and, determine the temperature correction. W76-00254

SEWAGE AND EFFLUENT-CHEMICAL ENGINEERING DEVELOPMENTS ON THE WAY,
P. Butler.
Process Engineering, p 85-87, June, 1975. 5 fig, 1 tab.

Descriptors: *Waste water treatment, *Chemical engineering, *Sewage treatment, Industrial wastes, Equipment, Activated sludge, Oxygen.
Identifiers: Physico-chemical treatment, ICI deep shaft process, Oxygen-activated sludge, Alwatech process, Alwafloc process, Catalytic oxidation.

New chemical engineering processes for effluent treatment are discussed. The ICI deep shaft aeration process for treating both sewage and industrial effluents is an air-lift type of fermenter, in which the air for biological oxidation also provides the driving force for liquid circulation. A pilot plant is now in operation at the Billingham sewage works, United Kingdom. Satec, U. K., (an Air Products Subsidiary) has been working on a pilot plant program for oxygen-activated sludge treatment. Research has been conducted on both mixed and staged variants of oxygen-activated sludge systems. The Rotapur process consists of physico-chemical treatment followed by catalytic oxidation. This process has been applied to sewage treatment, textile effluent treatment, pig slurry, industrial waste waters containing phenol, and gas cleaning/odor control. The Alwatech process is a purely physico-chemical method of treating food industry wastes combined with protein and fat recovery. The Alwatech process combines precipitation of the protein and/or fat with dissolved air flotation to bring the solids to the surface of the liquor where they can be skimmed off. The Alwafloc process for fat recovery treats waste water with trivalent metallic ions under acid conditions, followed by the addition of calcium ions to raise the pH and an anionic polyelectrolyte to strengthen the floc. The Alwatech process has been used in treating wastes from slaughter houses and poultry processing plants. The Alwafloc process has been used for effluents from poultry plants, margarine and edible oil plants, and in the petrochemical industry. (Orr-FIRL)
W76-00255

POLIOVIRUS INACTIVATION BY ACTIVATED SLUDGE,
Texas Univ., at Austin. Dept. of Civil Engineering; and Texas Univ. at Austin. Dept of Environmental Health Engineering.
J. F. Malina, Jr., K. R. Ranganathan, B. P. Sagik, and B. E. Moore.
Journal Water Pollution Control Federation, Vol 47, No 8, p 2178-2183, August, 1975. 6 fig, 2 tab, 10 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Viruses, Disinfection, Sludge disposal, Monitoring, Viricides, Sewage treatment, Public health, Diseases, Epidemiology, Microbiology.
Identifiers: *Poliovirus.

An evaluation of the permanent inactivation of virus in the activated sludge process was performed. Activated sludge was inoculated with tritium-labeled poliovirus in batch reactors, and the fate of the virus was followed by tracing the radioactive label and infectivity with time. The initial total virus in the systems was 4.8 times ten to the tenth power PFU. The initial adsorption of 1.9 times ten to the ninth power PFU/g of sludge w followed by a period of no significant reduction the titer in the supernatant. The decrease in infe tivity titer of the supernatant after a period of o hour followed the empirical relationship: the init virus concentration in the supernatant per gram initial MLSS (PFU/ml-g) equals the virus conce tration in the supernatant at any time t (PFU/ml times the time in minutes raised to a constant 0.32. The results indicate that some of t poliovirus adsorbed to the activated sludge par cles is inactivated and that virus particles that not infective may be released into the supernata However, the association of virus particles w sludge and the fact that infectious virus partic can be eluted from sludge solids must be co sidered in evaluating sludge disposal alternati and in virus monitoring techniques proposed sewage treatment plant effluents. INTERMITTENT SAND FILTERS FOR U GRADING LAGOON EFFLUENTS,
Utah Water Research Lab. Logan.
J. H. Reynolds, S. E. Harris, D. Hill, D. S. Filip, and E. J. Middlebrooks.
Public Works, Vol 106, No 9, p 91-94, Septemb 1975. 1 fig, 2 tab, 5 ref.

Descriptors: *Waste water treatment, *Lagoo *Filters, Water quality, Suspended soli Biochemical oxygen demand, Chemical oxy demand, Sands, Filtration, Sewage lagoons.
Identifiers: *Intermittent sand filters, Hydrat loading rate.

An experimental full-scale plant was built at lagoon treatment plant of the City of Logan, Ut to test the effectiveness of intermittent sand filt for polishing lagoon effluents. The facility c sisted of six filters, each 25 by 36 feet and conta ing three feet of pit-run concrete sand with an fective size of 0.17 mm and uniformity coeffici of 9.7. Data were collected and analyzed hydraulic loading rates ranging from 0.2 mgad 1.2 mgad. T alga genera present in the lagoon fluent had little effect on the performance of intermittent sand filters. The length of the fi run was directly related to the influent algal c centration and hydraulic loading rate. The efflu total suspended solids concentration increa slightly with an increase in the hydraulic load rate. When the average influent volatile suspen solids (VSS) concentration was 16.9 mg/liter, filters produced an effluent with less than mg/liter of VSS. The intermittent sand fi produced a consistent effluent BOD of less tha mg/liter and filtered effluent BOD and COD crease slightly with an increase in the hydra loading rate. The influent ammonia-nitrogen c centration were reduced from 2.5 mg/liter to than 0.54 mg/liter. The pH values of filter efflu were approximately 8.0 but ranged between and 8.9. The full-scale filter rests essenti duplicated the performance of laboratory and p scale tests. (Orr-FIRL)

AMMONIA REMOVAL-WHAT'S BEST,
Calgon, Corp., Pittsburgh, Pa. Wastewater Ap cations Research.
D. Mioduszewski.
Water and Wastes Engineering, Vol 12, No 7, p 36, 38, 40, 45-46, July, 1975. 4 fig, 2 tab.

Descriptors: *Waste water treatment, *Ammo Ion exchange, Denitrification, Nitrificat Chlorination, Activated carbon, Nitrogen, Co Cost comparisons.
Identifiers: *Air stripping, Breakpoint chlor tion, Chloramines.

The relative advantages and disadvantages of different processes for ammonia removal are c pared on an equivalent technical and econo basis. Ammonia removal by ion exchange invo

the displacement by ammonium ions of some other cation from an insoluble exchange medium. Natural zeolite, such as clinoptilolite, has shown the best selectivity for ammonia. The success of the clinoptilolite process is greatly dependent on the development and demonstration of an economical, practical, and environmentally sound method of recycling the regenerant. Two methods of treating the regenerant are ammonia stripping to the atmosphere or to recovery systems and breakpoint chlorination. Nitrogen removal can be achieved biologically through the processes of nitrification and denitrification. In the nitrification process, ammonia is oxidized aerobically to nitrite and then to nitrate. The denitrification step removes the nitrogenous oxygen demand; nitrate is anaerobically converted to nitrogen gas. The three major types of process configurations for nitrification-denitrification are combined sludge, separate sludge, and submerged filter systems. The air stripping process for ammonia removal involves raising the pH of the waste water to 10.5 to 11.5 and providing sufficient air-water turbulent contact and air flow to strip the ammonia gas from solution. Chlorination of waste water results in an increase in chloramine species up to a maximum after which the concentration of chloramines falls to a minimum which is termed the breakpoint. Addition of activated carbon to the process as a catalyst/dechlorinator seems to concentrate the oxidizing power of the applied chlorine. Air stripping is the least expensive treatment methods; ion exchange with regenerant recovery is the most expensive. (Orr-FIRL)

SHALLOW DEPTH SEDIMENTATION-A RATIONAL APPROACH TO WATER AND WASTEWATER CLARIFICATION,
National Environmental Engineering Research Inst., Nagpur (India).
R. Paramasivam, and P. S. Kelkar.
Journal of the Institution of Engineers (India), Vol 55, Part PH 2, p 46-50, February, 1975. 6 fig, 2 tab, 21 ref.

Descriptors: *Waste water treatment, *Water treatment, *Sedimentation, Settling basins, Hydraulics, Suspended solids.
Identifiers: *Tube settlers, *Clarification, *Shallow depth sedimentation.

The development of the shallow depth sedimentation principle is discussed. Diameter, specific gravity, shape and concentration of particles as well as temperature and tank hydraulics influence the settling characteristics of particles. The efficiency of sedimentation is dependent mainly on the surface loading or the tank overflow rate rather than on depth or detention time. One of the first (1915 patent) shallow depth sedimentation designs involved several shallow settling compartments formed by a series of conical circular trays placed one above the other. In the 1960's, the successful application of shallow depth sedimentation using small diameter (2.5-10.0 cm) tubes as settling devices was demonstrated. The two basic tube configurations are essentially horizontal and steeply inclined. Tube configurations meet the requirements of shallow depth, laminar flow conditions and reasonable overflow rates. The performance of the settlers depends largely upon the tube design. The tube height should be as short as possible to minimize the settling distance. Tube shape should permit nesting to eliminate waste space between tubes in a unit. Three proprietary tube settler units are described. Tube settlers are being employed at water treatment plants to reduce detention time or to increase capacity. Settling tubes used for the clarificcation of raw and trickling filter effluents were found to increase the capacity of existing clarifiers or improve the performance of poorly operating units. SEWAGE TREATMENT TO MEET TOMORROW'S NEEDS,
G. A. Truesdale, and M. R. G. Taylor.
Water and Pollution Control, Vol 74, No 4, p 455-565, 1975. 1 fig, 2 tab, 34 ref.

Descriptors: *Waste water treatment, *Sewage treatment, Treatment facilities, Sewage works, *Biological treatment, Costs, Water reuse, Water demand, Potable water, Irrigation, Filtration, Lagoons, Nitrification, Denitrification, Activated carbon, Membrane process.
Identifiers: *Physico-chemical treatment, *United Kingdom.

To meet the probable increase in water demand in the UK, it will be necessary to increase abstraction from rivers, resulting in an increase in the volume of sewage effluent requiring disposal and a reduction in the volumes of water in the rivers for diluation of this increased volume of effluent. Therefore, more stringent standards for sewage effluents will be required to protect potable water supplies. Processes that can be used to achieve higher effluent standards are discussed. The processes assume that sewage treatment will still be based on conventional biological methods with a combination of biological and physico-chemical methods were appropriate. The costs are based on 1971 conditions. Tertiary treatment processes discussed include: irrigation over grasslands; slow and filtration; retention in lagoons; rapid sand filtration; microstraining; gravel bed clarifiers; and, nitrification, denitrification, and phosphate removal methods. Water reclamation processes include: activated carbon adsorption; ion exchange; electrodialysis; reverse osmosis; and thermal processes such as multistage and multiple effect evaporation. The capital expenditure on sewage treatment in the UK has risen from 20 million pounds in 1950 to 160 million pounds in 1973. It currently amounts to more than 0.5% of the gross national product of the UK. (Orr-FIRL)

AERATION PLANT DESIGN: DERIVATION OF BASIC DATA AND COMPARATIVE PERFORMANCE STUDIES,
R. B. Badger, D. D. Robinson, and R. J. Kiff.
Water Pollution Control, Vol 74, No 4, p 415-429, 1975. 2 fig, 17 tab, 3 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, *Activated sludge, Design criteria, Laboratory tests, Pilot plants, Aeration.
Identifiers: Aerators.

A single-stage activated sludge plant employing vertically-mounted mechanical aerators was chosen as the most economical method of expanding the waste water treatment facility at Rodbourne, U.K. An experimental program was conducted to establish comparative operating data for four configurations of activated-sludge processes. The configurations were: single pocket completely mixed; two pocket series flow; four pocket series flow; and, interseries flow which comprises two pockets completely mixed followed by two pockets series flow. Bench-scale tests were performed on all configuratins. The interseries system proved to be the most ideal layout for effective bioflocculation. The Rodbourne sewage was easily treated by activated sludge; a low residual COD concentration and full nitrification were effected. A pilot-scale test was conducted using the interseries flow configuration. This experimental program identified the most stable mode of operation and provided a large amount of information on the variables involved. An assessment of the mean values and standard deviation for independent process variables was made to ensure that the plant will be able to comply with effluent standards 90 percent of the time. 'CATTY' ODOURS IN SEWAGE WORKS,
Thames Water Authority, London (England). Metropolitan Public Health Div.
J. V. Stedman, and P. J. Matthews.
Water Pollution Control, Vol 74, No 4, p 471-473, 1975. 8 ref.

Descriptors: *Waste water treatment, *Odor, *Sewage treatment, *Industrial wastes, Hydrogen sulfide, Sewage works.
Identifiers: 4-methyl-4-mercapto-pentan-2-one, Mesityl oxide.

'Catty' odors have been reported at industrial slag heaps and sewage treatment plants, in an industrial effluent, and in food storage. The 'catty' odor has been shown to be due to 4-methyl-4-mercapto-pentan-2-one, which results from a reaction between mesityl oxide and hydrogen sulfide. An investigation was conducted to determine the mechanism by which 4-methyl-4-mercapto-pentan-2-one could give rise to 'catty' odors at sewage works. The following conclusions were reached. Mesityl oxide reacts with hydrogen sulfide in crude sewage sludge to produce 4-methyl-4-mercapto-pentan-2-one which has a strong 'catty' odor. The sludge must be relatively fresh with a pH close to 6, and must have available sulfide present. If the pH of the sludge is higher than 6, then in the presence of sulfide, the threshold level of mesityl oxide for odor development may be as low as 0.01 mg/liter. If the 'catty' odor results from the caustic demethanolation of pentoxone, then the problem may be solved by replacing this solvent with methyl isobutyl carbinol. This implies that the presence of compounds, such as pentoxone, which may be precursors to mesityl oxide must be prevented to avoid the 'catty' odor in industrial waste water, sewage, and sewage sludge. (Orr-FIRL)

THE PERFORMANCE OF FULL-SCALE SLUDGE FLOTATION PLANT,
M. L. Burfitt.
Water Pollution Control, Vol 74, No 4, p 474-475, 1975. 1 tab, 2 ref.

Descriptors: *Sludge treatment, *Flotation, *Waste water treatment, *Sewage treatment, Treatment facilities, Suspended solids, Activated sludge, *Performance.

Operating data from the largest sludge flotation plant currently installed on a sewage works in the United Kingdom is presented. The sewage treatment plant at Aycliffe, UK, was expanded in 1972 for a dry-weather flow of 24,000 cu m/day and a population equivalent of 132,000 persons. Surplus activated sludge is consolidated in two 23 sq m flotation units prior to mixing, further consolidated with primary sludge, and subsequently digested and filter pressed. Using the flotation technique, a surplus activated sludge containg 5000 mg/liter suspended solids can be thickened to yield a sludge which contains 4.0% dry solids. The flotation technique is very efficient; it can remove 99.6% of the influent suspended solids. Due to the current excess capacity in the plant, the sludge loading rate has been slightly reduced to produce a thicker sludge float one-ninth of its original volume. (Orr-FIRL)

OBSERVATIONS ON THE PERFORMANCE OF POLISHING LAGOONS AT A LARGE REGIONAL WORKS,
Water Pollution Research Lab., Stevenage (England).

LIBRARY U. OF I. URBANA-CHAMPAIGN

I. P. Toms, M. Owens, J. A. Hall, and M. J. Mindenhall.
Water Pollution Control, Vol 74, No 4, p 383-401, 1975. 14 fig, 9 tab, 28 ref.

Descriptors: *Lagoons, *Sewage treatment, *Suspended solids, Biochemical findings, Oxygen demand, Bacteria, Nitrates, Retention, Effluents, *Waste water treatment, Phosphorus, Performance.
Identifiers: Phosphorus removal, Effluent polishing.

The use of lagooning as a polishing process was considered, in terms of number of lagoons, their retention periods, and depths required. Generally, except for the removal of phosphate and ammonia, it was found that several lagoons in series are better than a single lagoon of the same total retention period. The lagoons at Rye Meads Sewage Purification Works, Great Britain, were used for this study with the following conclusions. While lagooning of sewage effluent can be an efficient process for reducing suspended solids, BOD, fecal bacteria, nitrate, and phosphate, many of the required performance characteristics are not compatible. Thus, for the removal of the maximum amounts of ss, BOD, and fecal bacteria, lagoons should be operated in series. Because the growth of phytoplankton increases ss and BOD and reduces the mortality of fecal bacteria, it should be minimized by using a total retention period of up to four days in small consecutive lagoons. Fecal bacteria removal (due to amount of daylight) will be greatest in summer; in short-retention series lagoons, ss removal is not dependent upon the season. Conditions which favor the maximum removal of nitrate are the exposure of water to a maximal surface of mud. Removal rates up to 0.8 g N/sq m day are expected when denitrification is performed at the mud/water interface. Maximum phosphorus removal is possible when algae populations are at their maximum; their growth increases the pH of the water and causes precipitation of P as hydroxyapatite. While this algal growth occurs most rapidly during long (10 days or more) retention periods in single shallow lagoons in the summer, unacceptable ss and BOD may result. All of these findings are applicable to the 'polishing' of almost fully nitrified effluents. (Kramer-FIRL)

WASTEWATER SOLIDS SEPARATION,
P. N. Cheremisinoff, and S. M. Feller.
Pollution Engineering, Vol 7, No 8, p 26-33, August, 1975. 9 fig.

Descriptors: *Separation techniques, Filters, Filtration, *Waste water treatment, Diatomaceous earth, Screens, Sands, Equipment, Water treatment, Clarification, Settling basins, Particle size, Lagoons.
Identifiers: *Suspended solids removal, Rotary screens, Rapid sand filters, In-depth filters.

Various types of equipment for the removal of suspended solids from water and waste water are detailed. New methods meet high-level treatment requirements for nonbiodegradable wastes, independent of living organisms. The new systems described maintain predictable control and absorb shock loads with minimal effects on effluent quality. Screening equipment includes rotary screens to remove coarse solids from waste water; static screens emply a large screen surface at a steep angle so that dewatered solids travel down the surface of the screen into a sump; vibrating screens trap solids which are moved to the periphery of the screen element for disposal; microstrainers use a drum mechanism covered with a special weave fabric to separate small suspended particles. Of the many types of existing filters, the surface-contact type, or slow sand filters; sit on a system of collection and drainage pipelines; rapid sand filters are also surface filtration devices which are composed of a layer of graded sand supported on layers of graded gravel, some with coagulants added in a rapid mixing basin; moving bed filters are a continuous rapid sand type filter with a counter-current sand and influent flow directipon; in-depth filters are an improvement on the rapid sand filter, with a gradation of grain size from coarse to fine in the direction of the flow. Other separation techniques are diatomaceous earth filtration, a type of mechanical separation, and grass plots used as a system when effluents are irrigated over grasslands. Lagoons and oxidation ponds, settlers, thickeners, and clarifiers, are also described and illustrated. (Kramer-FIRL)

CURRENT TRENDS IN PACKAGED WASTEWATER TREATMENT FACILITIES, PART I,
New Jersey Inst. of Tech., Trenton. Dept. of Civil and Environmental Engineering.
R. Dresnack, and W. Miller.
Water and Sewage Works, Vol 122, No 8, p 60-63, August, 1975. 5 fig.

Descriptors: *Waste water treatment, *Treatment facilities, *Biological treatment, Organic wastes, Microorganisms, Activated sludge.
Identifiers: Contact stabilization systems, Completely mixed systems, Package plants.

A state-of-the-art report is presented on package waste water treatment plants. The advantages, disadvantages, process variations and cost variables of package plants are discussed. Performance data and a selection guide are also included. Package plants can be classified as using either biological or chemical treatment methods. There are significant differences among package plants using biological processes. The basic difference between the systems is the manner in which the required hardware is assembled. The digestion of organic wastes by microorganisms in the contact stabilization process is a two step process. In step one, the microorganisms consume the organic wastes. Metabolic digestion or biochemical breakdown of the material consumed occurs in step two. Two configurations of package contact stabilization units that are commercially available are a circular plant and a rectangular plant with a mechanical sludge handler. Completely mixed activated sludge systems operate as homogeneous systems where the organic waste is well mixed with the seed sludge during aeration. Many variations in size, shape and operational features can be found among completely mixed systems. (Orr-FIRL)

WATER-QUALITY REQUIREMENTS FOR THE CHEMICAL INDUSTRY,
Du Pont de Nemours (E. I.) and Co., Wilmington, Del.
A. W. Fynsk.
Journal of the American Water Works Association, Vol 67, No 2, p 65-66, February, 1975. 4 tab, 2 ref.

Descriptors: *Waste water treatment, *Chemical wastes, *Water quality standards, *Chemical industry, *Water utilization, *Consumptive use, Non-consumptive use, Cooling, Recirculated water, Standards, Water demand, Water treatment, Recycling, Boiler feed water, Corrosion, Industrial water.
Identifiers: Cascading.

The chemical industry is diverse. There are 27 different classifications of product lines defined by the Bureau of Census for the chemical industry. The industry uses about 4500 billion gallons per year. The water is used in the following percentages: cooling-80%, process-16%, and steam production, sanitation and potable water-4%. Consumption of water is only 9% of the water intake and further treatment of water is given to only 13% before use. Water quality requirements for cooling and industrial boiler feedwater are given. Most of the water used does not meet Drinking Water Standards (EPA). Recycling and cascading of water is feasible in many cases and will increase in use as the competition for available water supply grows and the costs of water supply and disposal increase. BIOLOGICAL TREATMENT OF EFFLUENT WITH ROTATING DISCS.
French Patent FR 2240-190. Issued April 11, 1975.
Derwent French Patents Report, Vol W, No 21, p 4, July, 1975.

Descriptors: *Patents, *Biological treatment, *Bacteria, *Waste water treatment, Equipment, Waste treatment, Aerobic treatment, Oxygenation, Effluents.
Identifiers: *Rotating discs.

A plant for the biological treatment of effluents using rotating discs was patented. These discs are partly immersed to provide growth support surfaces for bacteria which are alternately immersed in and withdrawn from liquid to be treated as the discs rotate. Thus, a disc carries on one or both faces one or more bundles of open-ended tubes. Discs are designed in sectors, made of polyvinyl chloride sheets set between radial, metal spoles set at less than 180 degrees to each other, bounded by a metal rim. Each sector carries a tube bundle. The plant purifies sewage or polluted effluents by an aerobic method employing contact with the discs on which bacteria are grown. Oxygenation of the bacteria is highly efficient as the disc rotates, as a result of the slight compression within the tubes as they are submerged and become filled with liquid followed by slight under-pressure as the discs rotates and the tubes are emptied. (Kramer-FIRL)
W76-00345

WASTE WATER PURIFICATION USING ACTIVE CARBON AND ASH.
French Patent FR 2241-502. Issued April 25, 1975.
Derwent French Patents Report, Vol W, No 22, p 8, July, 1975.

Descriptors: *Patents, *Waste water treatment, *Adsorption, *Activated carbon, Recycling, Sludge treatment, Dewatering, Sewage treatment, Waste disposal, Water purification.
Identifiers: Pyrolysis, Waste reuse.

A patent was issued for a method of waste water purification which uses activated carbon and ash obtained by pyrolysis of previously precipitated and skimmed off organic matter from processed sewage. Sludge from one settling tank is dewatered by filtration and the resulting almost dry solids are processed in a reactor. Some of the activated carbon and ash mixed with fresh water from this reactor is fed to the liquid in a second settling tank which receives the partially clarified water from the first process. After adsorption of the organic matter in this tank, sludge is pumped into a mixer in front of the first settling tank so that its adsorptive capacity may be utilized. Because of this recycling of the waste product, disposal of less than 0.1% of the original solids is necessary. (Kramer-FIRL)

ERTIARY TREATMENT OF WASTE WATER
ITH OZONE AND ULTRASONICS.
elgian Patent BE-821-971. Issued May 7, 1975.
erwent Belgian Patents Report, Vol W, No 21, p
July, 1975.

escriptors: *Patents, *Ozone, *Waste water
eatment, *Flocculation, *Polyelectrolyses,
perating costs, Capital costs, *Tertiary treat-
ent, *Ultrasonics.
lentifiers: Multi-stage waste water treatment.

multi-stage waste water treatment was patented.
waste water is treated with a coagulating
gent; treated with a polyelectrolyte flocculating
gent; and passed through a laminar flow separat-
g cell, where clarified liquid rises between close-
spaced plates and the bulk of residual solid im-
rities settle out. The resultant clarified liquid is
avitated by ultrasonic energy, and, while in this
ate, is contact-treated with ozone. Two sources
f ultrasonic energy should be used, one operating
a frequency of no more than 30 kHz, and the
her being at least twice the frequency of the
rst. Ozone contact takes place in a counter-cur-
nt column with the gas rising through descending
arified liquid. Thus tertiary treatment produces a
ery high standard of treated effluent and offers
ptimum economy of investment and low operat-
g costs. (Kramer-FIRL)

XYGEN DISSOLVING UNIT FOR AN AC-
IVATED SLUDGE PLANT.
etherlands Patent NL 7413-332. Issued May 9,
975. Derwent Netherlands Patents Report, Vol
, No 21, p 1, July, 1975.

escriptors: *Activated sludge, *Patents, *Waste
ater treatment, Reservoirs, Aerobic conditions,
xygen, Effluents, Treatment facilities, Dissolved
xygen.
lentifiers: *Oxygen dissolving unit, Package
eatment.

patented oxygen dissolving unit for an activated
udge plant is described. The apparatus is con-
ined in a tank with an inlet for incoming ef-
uents. The unit can be installed as a package
ongside a reservoir and is used to raise the
iological activity and thus the efficiency of aero-
ic purification of the waste water. Incoming ef-
uents may be pumped via a static mixing zone to
receiving zone beneath a gas space created by
ie pressurized oxygenating gas. From these, ox-
gen is dissolved in the static mixing zone into tur-
ulent effluent and the de-oxygenated gas has a
ent to the atmosphere. The receiving zone also has an outlet for oxygen- enriched effluent to return to the reservoir. Construction of the compact unit is inexpensive, and the directional adjustability of the outlet promotes optimum aerobic and circulatory conditions for activated sludge. (Kramer-FIRL)
W76-00349

SINGLE BASIN AERATED SEWAGE LAGOON WITH SPRING TIME INTENSIFIED AERATION,
Atara Corp., Montreal, (Canada). (Assignee).
D. S. Murphy.
United States Patent 3,897,334. Issued July 29, 1975. Official Gazette of the United States Patent Office, Vol 936, No 5, p 1834-1835, July, 1975. 1 fig.

Descriptors: *Sewage treatment, *Patents, *Aerated lagoons, *Waste water treatment, *Aeration, Sewage lagoons, Temperature control, Equipment.
Identifiers: High intensity aeration, Aerators.

A sewage treatment method was patented which consists of introducing raw sewage from an inlet at one end of a lagoon, passing this sewage through the lagoon in a flow path, and removing treated effluents at an outlet at the opposite end of the lagoon. Sewage is treated in a first zone of high intensity aeration by several densely disposed aerators located in rows across the flow path in the lagoon adjacent to the inlet, and is further treated in a second similar zone, where a second set of aerators are less densely disposed than the first. Sewage is then fed to a third zone of high intensity aeration with the group of aerators being more densely disposed than the second multiple; treated sewage is passed through a further zone between the third multiple of aerators and an outlet, through a zone without aerators. Thus, as sewage is passed from the first to the third multiple of aerators, the air supply to the first and second multiples of aerators is maintained and the air supply to the third set of aerators is controlled. The third group of aerators are capable of providing a zone of final high intensity aeration in the sewage being treated, and include a temperature control switch connected so that the conduits to the third mutiple of aerators are closed when the temperature in the lagoon falls below about 10C. SYNTHETIC SURFACTANTS IN URBAN EFFLUENTS AND THEIR RATE OF ELIMINATION IN BIOLOGICAL WASTEWATER TREATMENT PLANTS (SINTETICHSKIE POVERKHNOSTNOAKTIVNYE VESHCHESTVA V GORODSKIKH STOKAKH I EFFEKTIVNOST' OCHISTKI OT NIKH NA BIOLOGICHESKOY STANTSII),
Y. I. Kostovetskiy, G. M. Rakhov, and Y. I. Shteynberg.
Gigiyena i Sanitariya, No 2, p 95-96, 1975. 1 tab 3 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Surfactants, Coagulation, Filters, Aeration, *Biological treatment, Municipal wastes, Effluents.

The efficiency of biological waste water treatment plants in the elimination of synthetic surfactants from municipal waste water was studied. Mechanical settling reduced the surfactant concentration, ranging from 2.2 to 5.3 mg/liter originally, by 5-16%, while biological coagulation increased the elimination rate to 30%. Biological filters and aeration tanks had efficiencies of 40-48% and 47-78.3%, respectively. The overall efficiency of biological waste water treatment plants ranged from 48 to 80%, depending on the initial concentration and on the efficiency of the mechanical purification stage. Surfactant concentrations up to 10 mg/liter did not interfere with the operation of biological ponds. (Takacs-FIRL)

ONE-STEP NITRIFICATION AND CARBON REMOVAL,
Oklahoma State Univ., Stillwater. School of Civil Engineering.
E. L. Stover, and D. F. Kincannon.
Water and Sewage Works, Vol 122, No 6, p 66-69, June, 1975. 4 fig, 2 tab, 9 ref.

Descriptors: *Nitrification, Ammonia, Nitrogen, Chemical oxygen demand, *Waste water treatment, Microbial degradation, *Biological treatment, Carbon.
Identifiers: *Rotating biological discs process, *Carbon removal.

The rotating biological disc process has been shown to be very effective for biological nitrification. A two-year study from 1972 to 1974 was performed to determine the ammonia-nitrogen characteristics of a rotating biological contractor system operated at COD and NH3-N concentrations comparable to those of domestic waste water. Ammonia-nitrogen removal characteristics for shock loads were also studied. The principle of the rotating disc system is that the discs are partially submerged in waste water and the microbial population is passed alternately through waste water and air. The discs provide media to support fixed microbial growth, contact the growth with the waste water, and aerate the waste water to provide enough dissolved oxygen for aerobic biological activity. It was found that the system achieved complete nitrification at a hydraulic loading of 0.5 gpd/sq ft and influent COD and NH3-N concentration of 250 mg/liter and 27.6 mg/liter, respectively. The first stage removed 82 percent of the ammonia-nitrogen, with all removed by the fifth stage. The majority of the COD was removed in the first stage of the rotating disc unit. Shock load experiments showed that ammonia-nitrogen removal increased with increased COD and NH3-N concentrations because ammonia-nitrogen could be incorporated into cellular matter instead of oxidized to nitrate-nitrogen. Variables affecting nitrification capacity of the process were seen to be temperature, pH, presence of inhibitors, total applied loading, and the COD or BOD to NH3-N ratio. (Kramer-FIRL)

AN EXPERIMENT OF RAPID FILTRATION THROUGH DUAL-MEDIA BED FOR SECONDARY TREATMENT EFFLUENTS (NISO ROKA NI YORU NIJI SHORISUI NO ROKA JIKKEN),
T. Yoda.
Gesuido Kyokaishi, (Journal of Japan Sewage Works Association), Vol 12, No 132, p 54-63, May, 1975. 10 fig, 2 tab, 11 ref.

Descriptors: *Waste water treatment, *Filtration, Coals, *Tertiary treatment, Turbidity, Biochemical oxygen demand, Biological treatment.
Identifiers: Sand.

Tertiary treatment of sewage water by a two layer filtration technique is studied. The filtration layers considered were sand with a 0.58 mm effective radius, anthracite with 1.0 mm or 1.2 mm radius, and the combination of sand and anthracite used in equal amounts for a total bed thickness of 600 mm. The cross section of the filtration bed was 0.63 sq m, and six of such filtration beds were used to treat the water after second stage treatment. The six filtrations beds were combined at each bed outlet and the water filtered by each was mixed and discharged. The turbidity and BOD value of the filtered water were less than 6 and 8, respectively, for the sample water. The turbidity was 24 and BOD 28, at a filtration rate of below 600 m/day. The pH of the filtered water showed a slightly higher value than that of the unfiltered water; the former pH ranged from 7.25 to 7.80 and the latter ranged from 7.16 to 7.50. The best combination of layers was sand with the 1.2 mm radius anthracite. (Katayama-FIRL)

PURE OXYGEN TREATMENT OF WASTE-WATER,
FMC Corp., Itasca, Ill.
R. H. Stetzer.
Pollution Engineering, Vol 7, No 5, p 42-45, May, 1975. 4 fig, 1 tab.

Descriptors: *Oxygenation, *Biological treatment, *Waste water treatment, Biochemical oxygen demand, Chemical oxygen demand, *Aeration, Pilot plants, Suspended solids, Treatment facilities.
Identifiers: *Pure oxygen treatment.

Pure oxygen systems are compared with conventional air activated sludge methods for biological treatment of waste water. Advantages of oxygenation are high removals of BOD, COD, and suspended solids, at reduced costs. A pure oxygen system using a diffuser design with operation in an open aeration tank has been developed. Oxygen dissolution generates micron-sized bubbles deep in the mixed liquor, producing oxygen transfer efficiencies over 90 percent. Uncovered tanks have no enclosed pure oxygen atmosphere and thus require no alarms. These tanks allow the CO2 gases to escape to the atmoshpere, resulting in a high pH in the mixed liquor, which is advantageous for nitrification. Automatic control is maintained by a system of dissolved oxygen probes and analyzers. Pilot facilities of pure oxygen are in operation at treatment plants in Englewood and Denver, Colorado. This system may be used to upgrade existing facilities, often without tank modification. (Kramer-FIRL)

AN ASPECT OF THE SOLIDS RETENTION TIME CONTROL IN THE ACTIVATED SLUDGE PROCESS (KASSEI ODEN PUROSESU NI OKERU YOJO ODEN NO HAISHUTSU),
R. Ota.
Gesuido Kyokaishi, (Journal of Japan Sewage Works Association), Vol 12, No 133, p 52-57, June, 1975. 4 fig, 2 ref.

Descriptors: *Activated sludge, *Mathematical studies, *Waste water treatment, *Sludge treatment, Water quality control, Treatment facilities, Chemical precipitation.
Identifiers: *Japan, *Solids retention time(SRT), *Solids removal.

The sludge retention time (SRT) and total sludge quantity in a precipitation pool are considered mathematically based on the Walker's SRT Controlling Equation. The effects on water quality of periodic and nonperiodic sludge removals from the precipitation pool which may be governed by SRT control are considered as they relate to the sewage treatment plant at Fukashiba, in the Ibaragi Prefecture of Japan. Since the spread of sludge particle movement is faster than that of water, the sludge precipitation process is dependent upon the capacities of the aeration and precipitation pools for calculation of the volume of activated sludge. The concept of SRT control for water quality is not applicable to controlling total sludge quantity, and the SRT values must be determined empirically for each individual plant. The SRT value at the Fukashiba plant was estimated to be about 65 days, which was larger than the value estimated by Walker of 5 to 10 days for municipal waste water. However, the Fukashiba plant was treating large amounts of waste water from the petrochemical industry. Periodic or continuous removal of excess sludge from the precipitation pool gave a stable quality to the treated water, with the standard deviation of COD as 4 mg/liter, while non-periodic removal gave a deviation of between 12 and 29 mg/liter. (Katayama-FIRL)

EPA CREATES NEW SEWER AND PLANT INDEXES.
Engineering News Record, Vol 194, No 25, p 73-74, June 19, 1975. 2 tab.

Descriptors: *Construction costs, *Sewerage, *Waste water treatment, *Treatment facilities, Municipal wastes, Data processing, Computer programs, Model studies.
Identifiers: *Cost indexes.

A set of three municipal treatment plant and sewer project construction cost indexes is being published by the Environmental Protection Agency. These have been developed by the ICARUS Corporation and replace previous EPA indexes. The three basic indexes are large city advanced treatment (LCAT), small city conventional treatment (SCCT), and complete urban sewer system (CUSS). The indexes were computed on the basis of current technology, labor productivity, and vendor profits. Model plants which served as a basis for each index were constructed from a data base which is continually updated as innovations cause changes in the costs of various factors. In the case of the LCAT index, component configurations for a model 50 mgd and a model 5 mgd facility were selected, including bar screen, grit chamber, primary clarification, activated sludge, lime clarification, multi-media gravity filtration, chlorination, gravity thickening, vacuum filtration, and multiple hearth incineration. A computer program was then used to design a model plant, identifying major cost elements. For LCAT, these were: equipment (17.2% of total cost); civil material and labor (35.4%); piping material and labor (10.3%); electrical material and labor (2.7%); and construction overhead (22.5%). Index equations were formulated by finding those materials and/or wage rates that would typify the movement of a particular cost component. A profit adjustment factor and a productivity factor were included in this calculation. For creating the SSCT and the CUSS indexes, similar procedures were applied. (Kramer-FIRL)

INSTRUMENTATION AND AUTOMATION OF WASTEWATER TREATMENT SYSTEMS, (LITERATURE REVIEW),
National Environment Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
J. F. Roesler, and R. H. Wise.
Journal Water Pollution Control Federation, Vol 47, No 6, p 1369-1381, June, 1975. 136 ref.

Descriptors: *Automation, *Instrumentation, *Waste water treatment, *Reviews, Analytical techniques, Monitoring, Measurement, *Control systems, Computers, Pollutant identification, *Treatment facilities, *Bibliographies.
Identifiers: Process stream analyzers, Sensors.

Recent literature on automation systems for waste water treatment systems and on related instrumentation is reviewed. Process stream analyzers and sensors have been designed to measure substrate, physical and chemical properties, suspended solids, and biological activity. Monitoring of organic loads in waste water process streams by instrumented on-line analyses of total carbon, total organic carbon (TOC), and total oxygen demand (TOD) rather than by manually determined BOD is discussed. Widespread usage of on-line commercially available process stream analyzers is expected over the next ten years. These include equipment for monitoring nitrate-nitrite, ammonia, orthophosphorus, and total hydrolyzable phosphorus. Current techniques involving continuous pressure sensors are reviewed, including applications in flow and level measurements, density, viscosity, consistency, and leak detection. Advantages and disadvantages of various automatic control systems for waste water treatme processes are detailed. Mathematical models ar control strategy simulations may be used to pr dict system responses. Available microcompute and minicomputers for programmed data acqui tion and operational control were also surveye (Kramer-FIRL)

Identifiers: *Germany, Land application.

Studies of soil chemical composition and hygie investigations concerning waste water irrigation forests have been made. Untreated waste wa generated in the towns of Wolfsburg a Braunschweig, Germany, is discharged o croplands in summer, and in coniferous forest winter through percolation by means of mova plastic pipes. Investigations of soil samples fr the forests after percolation of waste wa revealed a significantly increased phosphorus c tent, and an increased soil pH due to increa sodium and calcium levels. However, most of calcium and magnesium inputs are adsorbed humus. Groundwater samples were seen to c tain no pathogenic germs, due to rapid decomp tion in the soil. The nitrogen concentrations of groundwater were below the maximum allowa level. Waste water irrigation caused the posit growth of young trees, and made the species co position of the udergrowth more variega (Nave-FIRL)

PLANNING AND CONSTRUCTION OF SEW AND DRAINAGE SYSTEMS (PLANNING U BAU VON KANALISATIONS--UND ENTWA SERUNGSANLAGEN),
W. Kiefer.
Technische Mitteilungen, Vol 68, No 5, p 159- May 1975. 5 fig, 13 ref.

Descriptors: *Storm runoff, *Waste water tr ment, Overflow, Rainfall, Planning, Sewer Sewers, *Drainage systems, *Treatment facili Storm water, Mathematical studies.
Identifiers: Storm retention basins, Rain yi Reinhold's curves.

General principles and problems of the plan and construction of sewer and drainage syst are presented. Runoff as a basis for the dimens ing of sewer systems may be calculated from pirical values as a function of both the numbe inhabitants and of the water infiltration, which function of the age of the sewer system. Storm noff is usually calculated on the basis of R hold's rain yield curves. The critical rain yie taken to be 15 liters/sec, which implies that a m larger quantity of water is to be fed into the w water treatment plant, and that the facility w require the use of additional storm overflow storm retention basins. ANOTHER LOOK AT THE NRC FORMULA
California Univ., Davis. Dept. of Civil Engi ing.
E. D. Schroeder, and G. Tchobanoglous.

Water and Sewage Works, Vol 122, No 7, p 58-60, July, 1975. 2 fig, 8 ref.

Descriptors: *Trickling filters, *Mathematical models, *Design criteria, Filters, Biochemical oxygen demand, Biological treatment, *Waste water treatment, Filtration.
Identifiers: NRC formula, Goodness-of-fit.

The (National Research Council) (NRC) formula on which a design model for trickling filters has been based was critically examined. The model was devised by NRC's Committee on Sanitary Engineering, Subcommittee on Sewage Treatment in Military Installations. While this model is widely accepted, data for the formula were obtained over thirty years ago. The equation of best fit was stated as: E (or percent efficiency)= 100 (weight of BOD removed by the filter and clarifier/weight of BOD applied including recycle). This was also expressed as E = 100/(1 + 0.0085 times the square root of (the weight of BOD5 per day/gross volume in acre feet x the number of passes through the filter)). When the NRC formula was developed, its two constraints were that efficiency was forced to be 100% when the loading rate was zero, and that recycling trickling filter effluent was assumed to be beneficial. When alternate methods of fitting curves through the data were considered, there was no fit found for which the quality was particularly good. The formula neglects differences in temperature, waste water constituents, media characteristics, and other factors, and considers only volumetric flow rate, BOD5, and filter volume. Thus, in designing a trickling filter, it was suggested that the engineer not use the NRC formula as a standard, but rather test any new facility by a pilot plant study. (Kramer-FIRL)

RECLAMATION OF METAL VALUES FROM METAL-FINISHING WASTE TREATMENT SLUDGES,
Battelle Columbus Labs., Ohio.
A. B. Tripler, Jr., R. H. Cherry, Jr., and G. R. Smithson, Jr.
Available from the National Technical Information Service., Springfield, Va. 22161 Environmental Protection Agency Cincinnati, Ohio, Report EPA-670/2-75-018, April 1975. 88 p, 8 fig, 17 tab, 50 ref. 1BB036;ROAP 21 AZO;TASK 11, 12010FXD.

Descriptors: Industrial wastes, *Waste water treatment, *Sludge, *Metal finishing, *Materials recovery, Electrowinning, Ion exchanginhg, Sludge disposal, Waste treatment.
Identifiers: *Waste metal recovery.

Efforts have included the determination of the worth of recovering metal values from metal-finishers' wastewater treatment sludges, the definition and research of processes for such recovery, and the selection, design, and costing of a recommended process. The study included a survey of the literature to determine the state-of-the-art regarding the generation, disposal, and recovery treatment practices relevant to metal-finishers' sludges, and to identify metal recovery processes possibly applicable to those sludges. This information was supplemented with a survey by questionnaire to determine the current status of relevant practices and conditions. Field investigations provided detailed examples of plant practices, sludge storage conditions, and sludge characteristics. The extraction of metal values from waste sludges by various leaching agents, and the recovery of metal values by techniques including electrowinning, cementation, and liquid-liquid ion exchange were studied. A portable pilot process for the treatment of waste sludges and recovery of metal values was selected and equipment and operating costs developed. (EPA)

BENCH-SCALE HIGH-RATE DISINFECTION OF COMBINED SEWER OVERFLOWS; WITH CHLORINE AND CHLORINE DIOXIDE,
O'Brien and Gere Engineers, Inc. Syracuse, N. Y.
P. E. Moffa, E. C. Tifft, Jr., S. L. Richardson, and J. E. Smith.
Available rom the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Cincinnati, Ohio. Report EPA-670/2-75-021, April 1975. 180 p, 48 ref. 1BB034; ROAP 21-ASY; Task 124. S-802400 (11020 HFR).

Descriptors: Urban areas, Storm runoff, Sewage, *Overflows, *New York, Tests, *Screenings, *Disinfection, Bactericides, *Combined sewers, Chlorine, *Waste water treatment, Laboratory tests, Viricides.
Identifiers: *High-rate treatment, Combined sewer overflows, Suspended solids removal, *Chlorine dioxide, Onondago County(NY).

A bench-scale study of high-rate disinfection of combined sewer overflows with chlorine and chlorine dioxide was performed to aid in the design and operation of full-scale prototype treatment facilities. Four logarithm reductions in three indicator bacteria and several common viruses were obtained with 25 mg/l chlorine or 12 mg/l chlorine dioxide in two-minutes contact time. Sequential addition of disinfectants enhanced the process such that only eight mg/l of chlorine followed in 15 to 30 seconds by two mg/l chlorine dioxide were necessary to obtain similar reductions. The removal of suspended solids by microscreening through a 23 micron aperture had little effect on disinfection efficiency. Disinfection increased slightly with increased temperature, and a study of the receiving waters indicated no bacterial or viral aftergrowth. Adenosine triposphate (ATP) was found to be a possible alternative to the bacterial indicators of disinfection efficiency and microbial contamination. Electron spin resonance (esr) was used as a primary standard method for quantitative measurement of chlorine dioxide residuals. (EPA)

PHYSICAL AND SETTLING CHARACTERISTICS OF PARTICULATES IN STORM AND SANITARY WASTEWATERS,
American Public Works Association, Chicago, Ill.
R. J. Dalrymple, S. L. Hodd, and D. C. Morin.
Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Cincinnati, Ohio. Report EPA-670/2-75-011, April 1975. 32 p, 14 fig, 8 tab, 31 ref, 3 append. 1BB034; ROAP 21-ASY; Task 107. 68-03-0272.

Descriptors: Regulations, *Waste water treatment, *Overflows, *Separation techniques, Hydraulic models, Particle size, *Combined sewers, *Settling velocity, Waste treatment, Storm Water, Model studies.
Identifiers: Solids separation, Overflow quality, *Particulate density, *Swirl concentrator.

An investigation was conducted, as part of model studies utilizing a swirl concentrator as a primary separator, helical combined sewer overflow regulator, and related studies, to characterize the properties of solids in sanitary sewage, combined sewer overflows, and stormwater runoff. Material suitable for monitoring efficiencies in hydraulic models of the swirl concentrator unit has been developed. The approach taken by Beak Consultants, Ltd., serving as a subcontractor to the American Public Works Association in the simulation sewage studies, was to match as closely as possible the settling characteristics of solids in three types of sewage and/or urban runoff with a well-defined, uniform artificial test material. An Amberlite Anion Exchange Resin (IRA-93), when ground and sieved to between 74 and 149 microns, was found to closely simulate the settling characteristics of domestic sewage. This material is of uniform density and appears to react according to Stokes' law for spherical particles at this size range. Arizona Road Dust, between 10 and 20 microns, was found to exhibit a similar-settling velocity distribution to that of the colloidal (or semi-colloidal) components of sanitary sewage flow. This report on these studies recommends that either or both of these materials be used in the scale-model efficiency trials. As background information for the selection of syntheszied solids, the settling characteristics (including size and specific gravity distribution) of sanitary sewage, combined sewer overflow and stormwater were determined. These values will be useful for future determinations of physical treatment process design and associated treatability. (EPA)

NUTRIENT TRANSFORMATIONS IN A SWINE WASTE OXIDATION DITCH,
Toronto Univ. (Ontario). Inst. of Environmental Sciences and Engineering.
P. H. Jones, and N. K. Patni.
Journal Water Pollution Control Federation, Vol 46, No 2, p 366-379, February 1974. 16 fig, 4 tab, 20 ref.

Descriptors: *Waste water treatment, *Phosphorus, *Nitrogen, Design, Swine, *Oxidation lagoons, Farm wastes, Hogs, Nutrients, Confinement pens.
Identifiers: Oxidation ditch, Land disposal, *Swine wastes.

Livestock production in confined areas is rapidly gaining popularity in North America as well as in Europe. Of the various possible systems for the treatment and handling of high-strength animal wastes, oxidation ditches are especially attractive because of their simplicity and economy. Jones, Patni and others have established the efficiency of oxidation ditches in reducing oxygen demanding carbon. This seven month study examines the behavior of nitrogen and phosphorus in such units. Nitrogen loss from the ditch was inhibited after about 20 weeks of operation as indicated by nitrogen accumulation in the ditch mixed liquor (DML). It seems that the nitrofication-denitrification scheme was disturbed by the introduction of wood shavings in the DML beginning about this time. It is concluded that, with proper design and operation, oxidation ditches can be used to effect a high degree of nitrogen removal from high-strength animal wastes. The study also indicated that controlled and regulated land application of the animal wastes treated in oxidation ditches (containing the accumulated phosphorus) seems at present to be the most practical way of preventing phosphates from reaching groundwater at animal waste treatment facilities. TREAT YOUR WASTE RIGHT,
G. Warren.
Soil Conservation, Vol 38, No 6, p 130-132, January, 1973. 3 fig.

Descriptors: *Waste treatment, *Waste disposal, *Sewage, *Louisiana, *Lagoons, *Streams, Water pollution, *Farm wastes, *Waste water treatment.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Rural Louisiana is freeing its streams and countryside from sewage, garbage, and animal wastes. The Soil Conservation Service in cooperation with the Louisiana State Board of Health provides technical help in designing and constructing sewage lagoons and animal-waste systems. The SCS is called on for soil maps and interpretations to help locate sites for both types of systems. A sewage lagoon system at Coushatta not only costs about one-tenth of what a treatment plant costs but it also keeps the sewage from going into the Red River. More than 150 animal-waste systems have been built in the state by dairymen. This type of waste no longer goes into the streams; it goes into the lagoon. (Cameron-East Central Oklahoma State)

TAKING CARE OF WASTES FROM THE TROUT FARM,
R. Jenson.
National Fisherman, Vol 52, No 9, p 15-A, February, 1972. 9 fig.

Descriptors: *Fish hatcheries, *Trout, *Water pollution, *Settling basins, *Waste disposal, Solid wastes.
Identifiers: *Fish wastes, Solids removal.

After development of obnoxious conditions in the Jordan River near a picnic area, the Jordon River Watershed Committee asked the Jordan River National Fish Hatchery near Alba, Michigan to correct the undesirable river conditions. It was determined that solid wastes from the hatchery were causing the problem. After studying solids removal attempts of Lamar National Fish Hatchery Development Center in Lamar, Pennsylvania, the Jordan River National Fish Hatchery set about designing its own settling basin. Important factors to be considered were retention time, weight of wet solids, water velocity and distribution, and depth of water. The final design consisted of two compartments, each of which had two trenches connected to a manhole pump which would separate and trap the solids. The wastes were then to be disposed of in one of the following ways: (1) as direct applied land fertilizer, (2) in a sewage disposal system, (3) as raw material for commercial fertilizer, (4) by transfer to a municipal sewage plant, or (5) by incineration. Descriptors: *Liquid wastes, *Solid wastes, Agricultural runoff, Lagoons, Irrigation, Drying, *Waste water disposal, Dairy industry, Chemical properties, Odor, Pests, Costs, Economics, *Farm wastes, Waste water treatment.
Identifiers: *Waste management, *Land spreading, Refeeding, Composting, Application rates.

This bulletin is designed to help dairy producers meet environmental limitation problems in the most practical and economical way. The first section deals with alternative waste management systems and their various components. Also included are sections on storm runoff control and parlor and milkhouse waste water control. Requirements and methods are given for preventing feedlot runoff and milkhouse waste water from reach surface waters. A utilization and land requirements section presents guidelines and examples of how much waste can be applied per acre. Odor control and pest control sections provide suggestions and methods for reducing odor and pest problems. An economics section gives cost data and contains a partial budget sheet so that comparisons between the alternative waste management systems can be made. (Cartmell-East Central Oklahoma State)

FARM EFFLUENT--ELECTRICAL DISPOSAL METHODS,
F. Barrett.
Effluent and Water Treatment Journal, Vol 11, No 4, p 207-209, April, 1971. 1 fig.

Descriptors: Effluents, *Farm wastes, Suspended solids, *Waste disposal, *Waste water treatment, *Oxidation lagoons, *Flotation.
Identifiers: *Electrical disposal methods, *Stabilization ponds, Oxidation ditch, *Electrolytic flotation.

The growth of more intensive stock farming has added urgency to the search for efficient, economical and acceptable methods for the disposal of farm effluents. Research has indicated that effluent from a herd of 90-100 cows can be dealt with efficiently and economically by spray aeration in a two section stabilization pond. Pig effluent can be made relatively innocuous by treating it aerobically in an oxidation ditch so that its oxygen demand is materially reduced by biological action. It is a process that avoids odor problems and which requires much less land for the disposal of the residue than would be required for untreated effluent. Electrolytic flotation using hydrogen and oxygen produced by the electrolytic breakdown of a small portion of the water in the effluent to raise the solids to the surface is a suitable low-cost method of overcoming most of the difficulties in the removal of suspended solids from effluent. EVALUATION OF METHODS FOR THE ANALYSIS OF PHYSICAL, CHEMICAL AND BIOCHEMICAL PROPERTIES OF POULTRY WASTEWATERS,
Cornell Univ., Ithaca, N.Y. Dept. of Agricultural Engineering.
T. B. S. Prakasam, E. G. Srinath, P. Y. Yang, and R. C. Loehr.
Presented at Special Meeting, American Society of Agricultural Engineers Committee SE-412, Chicago, Illinois, December 12, 1972, 71 p. 9 fig, 16 tab, 15 ref.

Descriptors: Research and development, *Analytical techniques, *Poultry, Physical properties, Chemical properties, *Waste water treatment, Farm wastes, Nitrogen, Odor, Pollutant identification, Water pollution sources.
Identifiers: *Biochemical properties, *Nitrogen control, *Odor control.

Research and demonstration studies were conducted on the treatment of poultry wastes for the past four years with particular emphasis on nitrogen control, waste treatment, and odor control. This research involved the analysis of raw and treated wastewater. Analytical methods were evaluated for their applicability to the routine analysis of animal and especially poultry wastewaters. Objectives of this research were to discuss the results of these investigations and to indicate satisfactory methods for the analysis of physical, chemical, and biochemical properties of poultry wastewaters. Samples of excreta voided from chickens housed at the Poultry Research Farm, Cornell University were used. The various methods used for the analysis of raw and treated poultry wastewater are described. (Cameron-East Central Oklahoma State)

CONTROLLING MANURE RUNOFF,
Pennsylvania State Univ., University Park.
A. R. Grout.
Feedlot Management, Vol 16, No 6, p 34-35, 38, June 1974. 1 fig.

Descriptors: *Agricultrual runoff, *Feed lots, *Slurries, *Liquid wastes, Lagoons, Basins, Methane Costs, Odor, Waste water treatment, Waste disposal, Oxidation lagoons, Dewatering.
Identifiers: Runoff control, Evaporation ponds, Composting.

There are several ways in which feedlot runoff may be controlled. Slurry manure can be stored in an open basin. Because this material will not stack, the walls must be high enough and strong enough to hold the semi-liquid manure inside. Solid manure from a bedded barn of partially dried manure from a feedlot can be stored with a stacker unit in a basin. In liquid manure systems slotted floors or concrete slabs can be used for removal of manure, and problems due to cold weather. Agricultural runoff can be reduced by roofing, diversion channels, and efficient evestrough systems. Detention ponds for runoff should be built according to state guidelines. Lagoons or stabilization ponds can cause a partial break down of manure nutrients in water. In oxidation ditches liquid manure is circulated and aerated in a race track shaped basin by a paddle wheel or propeller. Evaporation ponds reduce the amount of water for disposal, but are limited to areas of low humidity and rainfall. Composting and dewatering of solids is being practiced in some areas. Prodution of methane gas from animal manure by anaerobic digestion is another disposal alternative. (Cartmell-East Central Oklahoma State)

THE DESIGN AND OPERATION OF AN OPEN FRONT, SLOTTED FLOOR BEEF CONFINEMENT BUILDING,
Illinois Univ., Urbana. Cooperative Extension Service.
M. D. Hall, and F. McRoberts.
Presented at 1969 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 9-12, Paper No. 69-911, 3 p.

Descriptors: *Design, *Confinement pens, Cost, Waste disposal, Ventilation, Cattle, Agricultural runoff, Fertilizers, Performance, *Operation, Waste treatment, Farm wastes.
Identifiers: *Waste management, Feeding systems, Slotted floor.

In using confined feeding systems, practically all feeders are looking for the same thing: (1) profit on animals going through the system, (2) minimum labor and management requirements, (3) minimum odor and waste disposal problems, and (4) provision of a market for feed that is not easily marketable. There are four basic components to any feeding system that must be fit together: (1) feeding system, (2) waste disposal system, (3) environmental system, and (4) animal handling syste. The system studied was designed with a bunk feeding system. The waste disposal system consisted of

tted floor with a pit under it to catch the waste
d pumps to remove it. The main objective with
e environmental system used was to prevent
afts, keep the cattle dry in the winter, and pro-
le good shade with the best natural ventilation
ssible. Performance of cattle in the open-front
nfinement cattle barn was excellent when com-
red to with cattle in conventional feedlots. No
nificant health problems were experienced with
e inside or outside cattle, and the open-front
lar-type beef barn should work well in almost
y climate with minor changes. The manure was
ncentrated with no runoff, allowing maximum
e of manure as fertilizer and also allowing con-
l of ground water pollution to some extent.

selective ion exchange process was developed
the removal of ammonia nitrogen from waste-
ters. The process employs a natural zeolite,
noptilolite, which is selective for ammonium
s in the presence of sodium, magnesium, and
cium ions. The ion exchange equilibria of four
olites was investigated and clinoptilolite was
ected for further study on the basis of its am-
nium ion selectively and low cost. A mobile
monstration plant having a capacity of 100,000
lons per day was designed and constructed to
nove ammonia from wastewater. The plant con-
ns facilities for flocculation, sedimentation,
wdered activated carbon adsorption, disinfec-
n, and mixed media filtration followed by ion
change and associated regeneration equipment.
erations of the mobile plant with secondary ef-
ent resulted in ammonia removals of 97 and 93
rcent at 70,000 and 100,000 gallons per day
pectively; thus demonstrating that selective ion
change provides a highly effective means for
noving ammonia from wastewater. (Cameron-

ntifiers: *Waste control facilities.

e steps required for obtaining a permit for
estock operations where pollution potential ex-
s are given. Basically, the operator must first
uest a permit. The Department of Environmen-
tal Control then makes an inspection. If no controls are needed the permit is issued. If controls are needed, the Soil Conservation Service engineers design the controls and the operator places them into operation. Then the permit is issued. Samples of the forms to be filled out are included. (Marquard-East Central Oklahoma State)

RUNOFF CONTROL FOR A CREEK BANK FEEDLOT,
Agricultural Research Service, Lincoln, Nebr.
N. P. Swanson.
Presented at Livestock Waste Management System Design Conference for Consulting and SCS Engineers, Lincoln, Nebraska, February 15-16, 1973, 3 p. 1 fig.

Descriptors: *Livestock, *Farm wastes, Waste treatment, Waste disposal, Legal aspects, *Nebraska, Pollution abatement, Permits, *Treatment facilities.
Identifiers: *Waste control facilities.

Unless it is controlled, runoff from a feedlot on a flood plain or creek bank is a potential source of pollution. However, many times relocation of the feedlot by the owner is not feasible. One feedlot owner met this pollution problem by installing a ten foot high dike along the lower side of the feedlot next to the creek. The dike prevented runoff contamination of the water and flooding of the creek. It also provided comfort for the animals. Runoff from the feedlot was collected in a basin. Three riser inlets drained the basin into a sump. From there, the water was pumped to a holding pond from which it is spread as irrigation water to field crops. (Marquard-East Central Oklahoma State)

NEBRASKA ANIMAL WASTE RESEARCH,
Agricultural Research Service, Lincoln, Nebr.
T. M. McCalla.
In: Proceedings, Workshop on Livestock Waste Management, Ft. Collins, Colorado, Great Plains Agricultural Council Publication 56, p 18-28, 1972. 47 ref.

Descriptors: *Farm wastes, *Research and development, *Nebraska, *Feed lots, Runoff, Crop production, Costs, Management, Facilities, Odor, Terracing, Effluents, Water chemistry, Hydrology, Nitrates, Caissons, Waste disposal, Groundwater, Hydrology.
Identifiers: Loading rates.

Several different types of animal waste research are being studied. A discussion on each of the following is included in this paper: (1) land loading with manure, (2) costs for livestock waste management facilities, (3) feedlot runoff control and application of runoff on crops, (4) feedlot runoff control and feedlot waste management, (5) feedlot soil and water chemistry and groundwater hydrology, (6) runoff effluent disposal on cropland, and (7) odors. There is an explanation of each of these different studies; together with plans for continuing the research. (Cameron-East Central Oklahoma State)

THEORETICAL CONSIDERATIONS OF ANAEROBIC LAGOONS FOR POULTRY WASTES,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
E. P. Taiganides.
Second National Symposium on Poultry Industry Waste Management, University of Nebraska, Lincoln, May 19-20, 1964, 12 p. 1 fig.

Descriptors: *Lagoons, *Poultry, *Farm wastes, *Waste water treatment, *Waste disposal, *Anaerobic conditions, Odor, Design.
Identifiers: Flies, *Anaerobic lagoons.

Lagoons for the treatment and disposal of farm animal wastes are not the panacea they are reputed to be by the farm press. They have not been found suitable for the treatment of animal manures because of their high land surface and water requirements. The design criteria for the reduction of the solid matter of manure have not been established. Generally, lagoons will be judged by the following criteria: stabilization of the influent, control of odors, control of flies, and appearance. A properly functioning anaerobic lagoon should produce no vile odors. The main factors in anaerobic digestion are: temperature, loading rate, solids concentration, detention period, volatile acid concentration, solid matter accumulation and scum formation, essential nutrients concentration, toxic substances, and pH. Some of the design criteria for anaerobic lagoons discussed are: size, water depth, inlet, outlet, shape, and location. The most advantageous time to start a lagoon is during the summer. Seeding procedures are discussed. Mixing aids the manure degradation process. Flies will not breed in an anaerobic lagoon unless a scum forms. Good bacteria husbandry dictates the continuous feeding of the lagoon, except when it is frozen. The value of anaerobic lagoons will be better defined after the end of experiments now in progress. AN ANALYSIS OF BEEF CATTLE FEEDLOT DESIGNS FOR POLLUTION CONTROL,
Agricultural Research Service, Lincoln, Nebr. Agricultural Engineering Research Div.
C. B. Gilbertson.
Report ARS 42-201, August 1972. 8 p. 2 tab, 6 ref.

Descriptors: *Feed lots, *Design, *Analysis, *Waste treatment, *Waste disposal, Farm wastes, Costs, Odor, *Oxidation lagoons, Water pollution, Design Agricultural runoff, Incineration, Pollution abatement.
Identifiers: *Pollution control, Mounding, Paved feedlots, Unpaved feedlots, Housed feedlots, Composting.

Feedlot waste management alternatives of paved, unpaved and housed feedlots are discussed. Alternatives which are listed are mounding, composting, incineration, oxidation ditches and mechanical scraping. The physical requirements for each system are given. The method to be used will vary considerably with the cattle density; however, these observations can be made: (1) odor problems will limit outdoor feedlots in the future, (2) high labor costs and discomfort to cattle will limit development of paved feedlots, (3) housed feedlots will increase in the future due to high labor cost and pollution problems of outdoor feedlots, (4) for a housed feedlot unit, the costs of structure is about 50% of the total materials costs, and (5) use of oxidation ditches with housed feedlots will increase materials' costs by 17 to 20%. (Marquard-East Central Oklahoma State)

THINK OF MANURE AS A RESOURCE, NOT A WASTE,
Agricultural Research Service, Lincoln, Nebraska.
T. M. McCalla.
Feedlot Management, Vol 14, No 5, 2 p, May, 1972. 1 fig, 3 tab.

Descriptors: *Farm wastes, *Water pollution, *Agricultural runoff, *Feed lots, Settling basins, Fertilizers, Mounding, Recycling, Odor, *Waste treatment, Solid wastes.
Identifiers: Broad-basin terraces, Land disposal.

Pollution of streams and lakes by feedlot runoff is a problem, but technology is available to combat it. If runoff is caught in broad-basin terraces or is allowed to settle out in settling basins, 50 percent or more of the solids will settle out. Reasons for catching these settleable solids are: (1) They con-

LIBRARY U. OF I. URBANA-CHAMPAIGN

tain most of the easily biodegradable material. (2) They reduce retention capacity, (3) If they get into a retention structure, they create anaerobic conditions resulting in foul odors. These solids may be used on the land for crop production or they may be put back on the feedlot for mounding. Mounding serves two purposes: (1) Mounds create an area that drains readily, generally is dry, and offers protection to the cattle from adverse weather conditions; and (2) they act as a compost heap for decomposition on the lot. Besides being used as a fertilizer, manure can also be recycled as oil, feed, building materials, and as food for yeast which may be fed to animals. (Merryman-East Central Oklahoma State)

ANIMAL WASTE IN THE U. S. A.,
Massachusetts State Dept. of Agriculture, Worcester. Poultry Husbandry Adviser.
B. Hodgetts.
Agriculture, Vol 79, p 98-103, 1972. 3 fig.

Descriptors: *Farm wastes, *Waste water treatment, *United States, Aerobic treatment, Poultry, Lagoons, Degradation(Decomposition), Waste treatment.
Identifiers: *Land spreading, Anaerobic treatment, Duck wastes, 'Bressler' system, Composting, Dehydrated poultry wastes, Fly larvae.

This survey of American practice by an Englishman observes that 'land spreading is still, of course, generally the cheapest, most efficient and most popular means of disposing of animal manures, but the economic cost of doing this may in some cases be so high as to make the system unattractive.' Aerobic treatment of liquid wastes has advantages; its problems are foaming, sedimentation and high running costs. Aerobic treatment of solids by the 'Bressler system (Fan aeration in pits beneath cages) involves high capital costs. Composting is ineffective on poultry manure alone and, thus, involves blending with some other waste source. Anaerobic lagoons work admirable in the climate of Southern California with lagoon water being recirculated for flushing. Nutrient recycling and manure degrading with fly larvae are discussed. Fly larvae hold great promise in the 'the activities of the young larvae aerate and successfully deodorize the manure in 2-3 days and remove 50 percent of its moisture. The larvae are allowed to pupate and when dried and ground the pupae may be used as a protein source for the growing chick. The remaining manure may be further dried or pelleted and can be used as a soil conditioner or fertilizer, or even as a feed for catfish. The manure from 100,000 hens is expected to produce between 500 and 1000 lb of pupae meal daily.' (East Central Oklahoma State)

TREATMENT OF ANIMAL WASTES AT THE GREENFIELD LABORATORIES OF ELI LILLY AND COMPANY,
Lily (Eli) and Co., Greenfield, Ind. Greenfield Labs.
T. W. Bloodgood.
In: 21st Industiral Waste Conference Proceedings, Purdue University, Vol 50, No 2, p 56-61, March, 1966. 1 tab, 1 ref.

Descriptors: *Waste treatment, *Farm wastes, Livestock, Waste disposal, Lagoons, Aeration, Effluents, Sewage, Indiana.
Identifiers: *Greenfield Laboratories(Ind).

The waste treatment facilities at the Greenfield Laboratories handle the wastes generated by the thousands of animals used in the various production and research programs. There are five separate waste treatment plants that are located throughout the laboratories to serve the various research areas. Detailed description of wastes, treatment and disposal methods, and construction costs are given for each plant. The five plants are operated by two men from the Maintenance Department assigned to the Waste Treatment Operations. Total operating costs for all plants, not including utility costs, are approximately $55,000 a year. (Cartmell-East Central Oklahoma State)

FEEDLOT ODOR,
M. D. Paine.
In: Great Plains Beef Cattle Feeding Handbook, Cooperative Extension Service--Great Plains States, GPE-7800, L-1101, November, 1972, p 7800.1-7800.2.

Descriptors: *Feed lots, *Odor, *Aerobic conditions, *Anaerobic conditions, *Waste treatment, *Ammonia, Biological oxygen demand, Nutrients, Metabolism, Nitrogen, Aeration, Waste disposal.

Feedlot odor is caused by the anaerobic metabolism of nutrients found in cattle manure. However, when the nutrients are metabolized aerobically the end products are heat, CO_2, and water. For aerobic metabolism to occur, the oxygen transfer rate must exceed the biological oxygen demand. When the demand is greater than the transfer rate, anaerobic metabolism produces odor compounds. Ammonia is also produced in feedlots. It is lighter than air and has an irritating smell. It escapes as a gas from urine, but will be absorbed by moist manure. The transfer of nitrogen is ammonia and amines not only produces irritating smells, but may enrich ponds, hastening eutrophication. Odor occurs in three places--the dry surface, solid manure beneath the surface, and holding ponds. Aerobic metabolism depends on temperature, oxygen, and water; the last two may possibly be controlled. Moisture can be partially controlled by good drainage, cattle density and water. Since 40% moisture content is required for best aerobic activity, sprinkling may be required in dry seasons. Odor from ponds may be controlled by diluting nutrients, adding more water, or using aeration equipment. Manure may be stockpiled into compost heaps prior to being dispersed on farm land. HANDLING MILKING-PARLOR WASTE,
Otago Univ., Dunedin (New Zealand). Dept. of Microbiology.
R. G. Bell, and J. B. Robinson.
Canadian Agricultural Engineering, Vol 14, No p 56-58, December, 1972. 2 fig, 1 tab, 8 ref

Descriptors: *Dairy industry, *Farm wastes, C tle, *Waste treatment, Waste storage, Wa disposal, *Aeration, *Canada Chemical analys Odor, Chemical oxygen demand Septic tanl Lagoons, Irrigation, Nitrogen, Hydrogen ion c centration.
Identifiers: Milking-parlor wastes.

An assessment was made of the treatability o typical milking-parlor effluent by aeration to h determine the most feasible disposal method the watery waste. Four day's aeration of milk parlor waste produced a clarified effluent wit BOD of 200 parts per million. This effluent v not of a sufficiently high standard for dir discharge into a water course. It was conclu that aeration, followed by surface wa discharge, and septic tank disposal are unacce ble practices for disposal of milking-parlor wa in Ontario. Storage in an aerobic lagoon combi with spray or furrow irrigation is a feasible alter tive but is hampered by the winter conditi prevailing in the province. Where the manure is ready being handled as a liquid, the most satisf tory alternative would appear to be combining milking-parlor waste with the manure where liq storage is available. 24 MILLION POUNDS OF OPPORTUNITY,
Cloisterdale Farms, Ephrata.
G. Herr.
In: Summary of Symposium on Conversion of Poultry Waste, Lancaster Farm and Home Center, Lancaster, Pennsylvania, November 10, 1971, 14 p. 1 fig.

Descriptors: *Farm wastes, *Waste disposal, *Recycling, *Waste treatment, Poultry, Cattle, Hogs, Lagoons, Odor, Fertilizer, Irrigation, Dehydration, Incineration, Costs.
Identifiers: *Shud, *Agri-business, Composting, Land spreading, Semi-dry waste, Refeeding, Community Relations.

Agri-waste not only is a problem to our environment, it also is a huge untapped resource. Many problems stand in the way of utilization of this resource, but if everyone works together, pollution caused by waste can be lessened and waste can be used beneficially. Experiments at Cloisterdale Farms have indicated that even large operations can handle their waste by gradually converting waste to semi-dry; thus reducing waste moisture to 28-35%. Odor free semi-dry waste can then be hauled off and spread on land. Also, possible dehydration might lend to fertilizer products, re-feeding, composting or other uses of waste. Conclusions indicate that liquid handling; be it lagoon, irrigation or hauling would not be the long range answer to disposal problems. Getting rid of the waste is not just a problem; getting rid of it profitably is an opportunity. (See also W76-00476) (East Central Oklahoma State)

MANURE REDUCTION AND CONVERSION METHODS OF THE FUTURE,
Pennsylvania State Univ., University Park. Dept. of Poultry Science.
G. O. Bressler.
In: Summary of Symposium on Conversion of Poultry Waste, Lancaster Farm and Home Center, Lancaster, Pennsylvania, November 10, 1971, 4 p.

Descriptors: *Farm wastes, *Dehydration, *Waste treatment, *Poultry, Drying, Environment, Anaerobic bacteria, Odor.
Identifiers: Drying pits.

Pennsylvania State researchers have been investigating dehydration of manure as an economic solution to waste problems and have developed a two-stage drying system. In stage one, the use of high velocity air movement and mechanical stirring of the manure in the pit reduces each 2.9 tons of manure to 1 ton, a reduction of about 3 to 1. The resulting manure can be easily transported with a minimum of odors. Stage two dries the remaining manure in a dryer to a moisture level of about ten percent. The result is a fine, dry manure product, free from offensive odors and able to be stored without deterioration or odor formation. Dehydration offers the best hope for the future. Not only does this method have the advantage of reducing the quantity of material and offensive odors, its influence on improvement of the poultry house environment may show additional benefits. Working conditions for the caretaker would also be improved. These advantages may very well off-set some of the costs of handling manure by the dehydration method. ECONOMICS OF MANURE HANDLING,
Pennsylvania State Univ., University Park. Dept. of Agricultural Economics.
A. P. Stemberger.
In: Summary of Symposium on Conversion of Poultry Waste, Lancaster Farm and Home Center, Lancaster, Pennsylvania, November 10, 1971, 1 p.

Descriptors: *Farm wastes, *Poultry, *Waste disposal, Cost analysis, Economics, Waste treatment.
Identifiers: *Waste management, Conversion.

Data was collected by personal interview of managers of egg production enterprises and by observation of operations whenever possible. Information was collected regarding type of waste disposal systems used, investment necessary, operating costs, labor required, odor and insect problems, method and frequency of manure removal and disposal, size of operation and performance of layers. This information is being analyzed to determine costs of handling and removing manure from egg laying houses by various methods. An investigation of costs of methods of processing raw manure into saleable products, size of market, and estimation of demand for poultry manure products is being conducted. The objective is to determine manure handling costs for various systems. Naturally, the industry is interested in methods with the least cost. But, they also realize that the least-cost system of handling manure may not always be the best one. They are striving to find a system that does not affect layer performance and produces a desired saleable end product. After careful study of specific operations, results will have to be used with caution. (See also W76-00476) (Russell-East Central Oklahoma State)

MODIFY YOUR POULTRY HOUSE FOR MANURE DRYING,
Pennsylvania State Univ., University Park. Poultry Science.
F. W. Hicks.
In: Summary of Symposium on Conversion of Poultry Waste, Lancaster Farm and Home Center, Lancaster, Pennsylvania, November 10, 1971, 6 p.

Descriptors: *Farm wastes, Poultry, *Drying, Dehydration, *Waste treatment, Waste disposal, Odor, Ventilation, Air conditioning, Environmental control, Lagoons, Aerobic bacteria, Anaerobic bacteria.
Identifiers: *Poultry house, In-house drying.

A lot of material is being written about efficient and practical waste handling, but no one has devised the system which could be considered the final answer to poultry housing and waste management. It seems that drying or dehydration is the best answer, and one easily utilized drying method is from the ventilation system within the poultry house. The partially dried waste could then be spread on land, allowed to be broken down by bacteria, or stored. In-house drying also reduces odors significantly, and usually very little house modification is necessary. No matter what type of waste handling system is used, it must be: (1) Socially acceptable to neighbors, (2) Economically feasible and practical, (3) Mechanically possible and simple, (4) Legal according to local and federal regulation. If at all possible, waste should be disposed of in such a way that it may be recycled to avoid a drain on natural resources. (See also W76-00476) (Russell-East Central Oklahoma State)
W76-00480

THE ECONOMICS OF RECYCLING CONVERTED POULTRY WASTE THROUGH CATTLE,
Pennsylvania State Univ., University Park. Dept. of Animal Science.
T. A. Long.
In: Summary of Symposium on Conversion of Poultry Waste, Lancaster Farm and Home Center, Lancaster, Pennsylvania, November 10, 1971, 6 p, 2 tab.

Descriptors: *Farm wastes, *Poultry, *Recycling, *Waste disposal, Litter, Organic matter, Proteins, Costs, Waste treatment.
Identifiers: *Wastelage, *Refeeding, Ensilage.

Experiments have shown that poultry manure and litter fed to cattle as part of a balanced ration can give satisfactory results. Poultry waste is especially good as a protein supplement for ruminants, because rumen microorganisms are able to utilize the nitrogenous compounds of the manure and synthesize bacterial protein which can then be utilized by the host animal. Many factors favor use of poultry waste as feed. It would be an economic and efficient use of a huge resource and would remove the large problem of waste management. Experiments were conducted on Hereford steers to evaluate nutritional and economic feasibility of using fresh poultry excreta as a major component of wastelage. Three growing rations calculated to support 1.65 pounds of body weight gain per day were devised and cost per hundred pounds of gain calculated. When results were tabulated, it was found that while all rations gave economical gains, it would have cost about 45% less per hundred pounds gain when the cattle were fed corn wastelage as compared to alfalfa hay. W76-00481

SOME POTENTIAL USES FOR DEHYDRATED POULTRY WASTES,
Pennsylvania State Univ., University Park. Dept. of Poultry Science.
O. D. Keene.
In: Summary of Symposium on Conversion of Poultry Waste, Lancaster Farm and Home Center, Lancaster, Pennsylvania, November 10, 1971, 11 p, 4 tab, 15 ref.

Descriptors: *Farm wastes, *Poultry, *Dehydration, *Recyling, *Waste treatment, *Waste disposal, Nutrition, Nitrogen, Proteins, Ruminants, Bacteria, Insects.
Identifiers: *Refeeding, Uric acid, Environmental protection.

Disposing of poultry waste is a problem which is increasing in magnitude. Recycling as feed offers promising results to researchers. Inclusion of poultry manure into diets of ruminants has been reported by many investigators, and ruminants apparently can use many of the ingredients found in poultry wastes. However, incorporation of manure into the diets of poultry has had limited success. The major basis for this is uric acid. Uric acid apparently is detrimental to poultry by acting as an irritant in the intestinal tract. Due to experiments, it seems apparent that refeeding poultry manure back into poultry has very limited possibilities. Research into other areas of disposal is also being conducted. Insect disposal of waste is one possibility, but much study needs to be done before we engage in large scale use of insects. Also bacterial fertmentation is a possible avenue for disposal. No matter what the method there will be problems, but perhaps a feasible working solution will result from further research and study. (See also W76-00476) (Russel-East Central Oklahoma State)

APPLICATIONS TO PLATING WASTEWATER TREATMENT OF SLOPED PLATES SETTLING TANK (KEISHA-BAN SHIKI CHINDEN SO NO MEKKI HAISUI SHORTI E NO OYO).
Sangyo Kogai, Vol 11, No 7, p 660-669, July, 1975. 25 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Metals, Coagulation, Mixing, *Chemical precipitation, Oxidation, Neutralization, Suspended solids, Chromium, Monitoring.
Identifiers: Metal plating wastes, Japan, Cyanide.

LIBRARY U. OF I. URBANA, [illegible]

The joint research of the Industrial Pollution Control Association of Japan and Yasukawa Electric Manufacturing Company on water treatment techniques for metal plating waste water is presented. A new precipitation bath and a unique coagulation-mixing bath and the operational results obtained from experimental studies were discussed. The metal plating waste water was treated by ordinary techniques in oxidation and neutralization reactions. However, both the coagulation-mixing bath and precipitation bath exhibited unique features. The former bath utilized a vertical motion mixing technique to strengthen the coagulating effect, and the latter bath was equipped with sloped plates which reduced the necessary size of the precipitation bath. The capacity of each bath was 30 cu m/hr waste water. The precipitation bath contained 89 vinylchloride plates (100 x 200 x 2 mm) placed 50 mm apart at a 60 degree angle with respect to the surface of the water. Ferric chloride and a high polymer coagulant were added to the coagulation-mixing bath at concentrations of 50 ppm and one ppm, respectively. A sludge concentration of 1.3 percent was obtained after a 20 min precipitation time. The quality of the treated water was better than 1/2 of the water quality standard. The suspended solids concentration was 5 ppm, no cyanide ions could be detected up to a 0.01 ppm limit, and the amount to monitor the treatment facility. Periodical removal of sludge from the precipitation bath was performed using an ultrasonic sensor. The maintenance of the sloped plates was not complicated. The particle adhesion onto the plates did not grow deeper than 2 mm, and cleaning only once or twice a month was sufficient. (Katayama-FIRL)

ACTIVATED CARBON TREATMENT OF PAPER AND PULP EFFLUENTS, (KAMI PARUPU HAISUI NO KASSEITAN SHORI),
T. Shogenji.
Yosui to Haisui, Vol 17, No 8, p 1016-1022, August, 1975. 13 fig, 6 tab, 10 ref.

Descriptors: *Waste water treatment, *Industrial wastes, Pulp and paper industry, *Activated carbon, Lignins, Adsorption, Chemical oxygen demand, Pre-treatment, Water reuse, Dyes, Surfactants, Alkyl benzene sulfonates, *Pulp wastes.
Identifiers: Activated carbon regneration.

The activated carbon treatment of pulp and paper waste water is summarized. Pulp waste water contains high molecular weight compounds such as lignin, and behaves differently from ordinary waste water when treated with activated carbon. The adsorption rate of lignin to the activated carbon is slower than that of ABS and dyes. The saturation of activated carbon occurs with lower levels of COD in pulp waste water than in sewage water. For a pre-treated pulp waste water containing 59 ppm COD, 100 mg COD were reported to saturate one g activated carbon; the amount of COD saturation on the carbon increased with decreased pH of the waste water from 10.6 to 7.6. It is a costly operation to use activated carbon to lower the COD value of pulp waste water to 10 to 20 ppm. Therefore, pre-treatment of raw waste water prior to activated carbon treatment is necessary. Pretreatment can be by physical, chemical, and/or biological methods. Combinations of methods are very economical as well as effective in purifying the pulp waste water for reuse. Activated carbon can be regenerated by heating. The regenerated activated carbon increases its adsorptivity for kraft lignin, this is attributed to the increased micropore sizes in the regenerated carbon caused by heating. The construction cost of treatment plants for pulp waste water and the required amount of activated carbon increase as higher BOD removal efficiency is demanded. (Katamya-FIRL)
W76-00493

INDUSTRIAL EFFLUENTS CLEANING AUTOMATIC REGULATION.
Soviet Patent SU 453360. Issued January 1, 1975.
Soviet Inventions Illustrated, Vol W, No 25, p D6, July 29, 1975, 1 fig.

Descriptors: *Waste water treatment, *Industrial wastes, Flotation, Electrodes, Suspended solids, Electric currents, Oil industry, Textiles, Metals, Food processing industry, Automatic control.
Identifiers: *Electro-flotation.

An automatically controlled electroflotation cleaning process has been patented which is suitable for treating effluents from the oil, metallurgical, meat, and textile industries. It involves passing current between electrodes in a flotation tank. In order to improve the cleaning effectiveness and provide savings in power, the current density to the electrodes is varied in proportion to the degree of suspended solids concentration allowable in the treated effluent. The flotation installation contains an electrode system and an effluent components sensor connnected to a regulator and rectifier. The suspended solids concentration in the untreated effluent affects the current density between the electrodes. By varying the current density, any degree of purification may be obtained. (Orr-FIRL)

CLOSED CIRCUIT PAPER MILL EFFLUENT TREATMENT.
French Patent FR 2246-690, Issued June 6, 1975.
French Patents Abstracts, Vol W, No 28, p F6, August 19, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, Pulp and paper industry, *Water reuse, *Recycling, Closed conduits, Water circulation, *Pulp wastes.
Identifiers: *Zero discharge.

A patent has been issued for a closed circuit paper mill effluent treatment process. The total effluent containing fibers and chemicals produced from paper manufacturing is collected in separate closed circuits. Part of the untreated effluent is used for pulp heating and dilution. The remainder is collected in at least one other closed circuit, regenerated by the addition of chemicals, conditioned, and then supplied to the papermaking process in place of fresh water. The advantages of the system include: a smaller consumption of fresh water; almost complete elimination of waste water and sludge disposal; no harmful effect on sludge dewaterability; no build-up of salts; and, the use of a smaller quantity of expensive chemicals. Complete utilization of the feed material is effected with improved pulp dispersion and dewatering capacity due to the higher temperatures. (Orr-FIRL)
W76-00496

TEXTILE DYE EFFLUENT TREATMENT.
French Patent FR 2246-501. Issued June 6, 1975.
Frech Patents Abstracts, Vol W, No 28, p F2, August 19, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, *Dyes, *Textiles, Activated carbon, Biological treatment, Chemical oxygen demand, Water reuse.

A treatment system for textile dyeing waste waters has been patented. The effluents from textile dyeing are purified in a two-stage treatment process consisting of biological treatment followed by adsorption. In the first stage, the COD of the influent is reduced to 350-450 mg/liter. The effluent from the first stage is then passed through an activated carbon filter. The process produces an effluent with a very low final COD level without the addition of flocculants. It is well suited for the reuse of water for industrial purposes. (Orr-FIRL)

USED OILS AS SOURCES OF RAW MATERIALS AND OF ENERGY (LES HUILES USAGEES SOURCE DE MATIERES PREMIERES ET D'ENERGIE),
R. Audibert, and P. Trambouze.
Informations Chimie, No 145, p 119-120, 123-127, June, 1975. 12 fig, 7 ref.

Descriptors: *Waste water treatment, *Industrial wastes, Oil industry, *Oil wastes, Fuels, Suspended solids, Flocculation, Filtration, Incineration, Energy.
Identifiers: Used motor oil.

The problems and possibilities of the utilization of used oil, especially of used motor oil, as an energy source and in the production of new oil are discussed. In view of the serious pollution hazard involved in disposing of used oils, their utilization is justified in all cases. Used motor oil can be burned together with standard fuel oil in conventional burners when added in relatively small quantities, but requires special equipment for ash and lead separation when burned along. When the used motor oil is going to be used in the production of new oil, mechanical impurities must be removed by filtration, after which water and lightweight hydrocarbons must be eliminated. Suspended solids may be separated by flocculation using solvents or sulfuric acid or by thermal methods. Treatment with sulfuric acid or hydrogenation is necessary for the separation of soluble oxidized compounds before vacuum distillation. The energy expenditure required for recovery of used oil is lower than that required for the initial production. (Takacs-FIRL)

WATER BUDGET OF A REFINERY (WASSERHAUSWIT EINER RAFFINERIE),
M. Siebert.
Umwelthygiene, Vol 1, No 7, p 189-191, July 1975. 5 fig, 7 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Oil industry, Water utilization, *Water reuse, Water circulation, Water treatment, Phenols, Emulsions, Recycling, Hydrology, budget.
Identifiers: *Refineries, Closed water cycles, Oil/water separation.

The water budget and complete water cycle of the Mobil Oil Refinery at Woerth, West Germany, are described. Well-water to be used in the refinery is treated with lime and chlorine-oxidized ferrous sulfate for decarbonization and the removal of organic components. Boiler feed-water is prepared by means of gravel filters, ion exchange and combinations of these. The ion exchange resins are regenerated with hydrochloric acid and sodium hydroxide which are subsequently neutralized. The pH of the cooling water, containing a corrosion inhibitor, is adjusted to a 7.5 by means of sulfuric acid. The phenols in the liquor used for gasoline washing are separated by pH adjustment. These phenols are currently incinerated, but the reuse for useful purposes is envisaged. The hydrogen sulfide and mercaptans in process waters are separated in an acid water stripper. The waste water thus purified is reused for the desalting of crude oil. While oil-free waste waters, such as storms water, are treated mechanically, oily waste waters are treated in a mechanical oil separator, after which the emulsion is broken in an aerated flotator. (Takacs-FIRL)

5E. Ultimate Disposal Of Wastes

ON THE COMPOSTING OF WASTES FROM THE PULP AND PAPER INDUSTRY (UEBER DIE VERKOMPOSTIERUNG VON ABFAELLEN DER ZELLSTOFF UND PAPIERINDUSTRIE),
F. Opderbeck.
Das Papier, Vol 29, No 7, p 308-312, July, 1975. 5 fig, 3 ref, 2 tab.

Descriptors: *Bark, *Sludge, *Pulp and paper industry, *Waste treatment, Nutrients, Mixing, Wastes, Industrial wastes, Water pollution sources, Sludge treatment, Sludge disposal, Waste disposal, Economics, Marketing, Water pollution control, Solid wastes.
Identifiers: *Composting.

The waste-processing study group of the Verein Zellcheming's technical committee for environmental problems has dealt with the possibilities of composting pulp and paper industry wastes. These investigations are reported. Following a short description of the chemical composition of sludge and bark, as well as the anatomical structure of the latter, the preparation of bark for composting and mixing with sludges and any required nutrient salts are dealt with. The conducting of composting experiments as well as the most important processes and resulting grades and qualities of compost are described. Problems of eocnomics and marketing are also covered. (Speckhard-IPC)

Identifiers: *Hydraulic fracturing, *Piceance basin(Colo).

By the utilization of commercially available and specially designed equipment, hydraulic fracturing experiments were conducted on a regional scale in the Piceance Basin of northwest Colorado. These tests confirmed that vertical fractures may be hydraulically induced at well-face injection pressure of about two thirds of the total overburden load. Further, the fractures will continue to propagate vertically as long as injection pressure exceeds the combined value of least principal horizontal stress and tensile strength which may lead to contamination of potable water aquifer and may trigger earthquakes. Water and Sewage Works, Reference Number, R45, R48, R50, R53-54, R56, April 30, 1975. 1 fig, 7 tab, 23 ref.

Descriptors: *Waste water disposal, *Waste water treatment, *Reviews, Soils, Irrigation, Overland flow, Infiltration, Groundwater, Costs, Legislation, Surveys, Water pollution control, Water reuse.
Identifiers: *Land application.

A review is presented on the treatment of sewage effluents by land application. Research sponsored by various government agencies is being performed to gain a greater understanding of the ability of soil to treat waste water by physical, chemical, and biological means. Proper management and monitoring are required for successful land treatment systems. Land treatment can compete in many locations with advanced waste water treatment. Land treatment can be used in water pollution control systems in place of, in addition to, or in conjunction with conventional treatment methods. Topics covered in the review include: surveys; legislation; irrigation; overland flow; infiltration-percolation; waste water quality; and, cost of land treatment. Land treatment and recycling are encouraged by PL 92-500. Irrigation, the most commonly used land application method, is the application of water to the land to meet the growth needs of plants either by surface or spray application. Overland flow is a modification of spray irrigation to impermeable or poorly drained solids. In overland flow, a substancial portion of the waste water applied is designed to run off and must be collected and discharged to receiving waters or reused. Infiltration-percolation systems are characterized by percolation of the majority of the waste water through the soil to the groundwater and is restricted to rapidly permeable soils. Costs of land treatment systems will include the land, earthworks, pumping and transmission facilities, distribution systems, monitoring facilities, and for some systems, collection and storage facilities. TREATMENT OF SLUDGE FROM SEWERAGE AND BURNT ASHES,
Environmental Protection Agency, Research Triangle Park, N.C.
F. Yanagi.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-237 731-T, $3.25 in paper copy, $2.25 in microfiche. Japan Patent Agency, EPA-TR-24 73, August 15, 1966. 7 p, 1 fig.

Descriptors: *Patents, *Sludge treatment, *Dehydration, *Incineration, Precipitation(Chemical), Sewerage, Waste disposal, Sludge disposal, *Waste treatment.

An application for a patent to treat sludge from sewerage and burnt ashes has been filed. The method of treatment of ash and exhaust gas from the burning of dehydrated sludge solids is detailed. The burned ash will be divided into a portion containing iron compounds and one containing calcium, and these will be collected for reuse as precipitates. The steps of filter dehydration and burning of the sludge are combined into one process in this invention. A diagram of the procedures is provided for graphic illustration. (Kramer-FIRL)

SEWAGE TREATMENT AND DISCHARGE INTO TROPICAL COASTAL WATERS,
University of the South Pacific, Suva (Fiji). School of Natural Resources.
D. B. Nedwell.
Search, Vol 5, No 5, p 187-190, May, 1974. 2 fig, 25 ref.

Descriptors: *Eutrophication, *Effluents, Sewage disposal, Algae, Sewage treatment, Waste water treatment, Tertiary treatment.
Identifiers: *Tropical coastal waters, *Mangroves.

Sewage discharged into coastal seawater in tropical areas is most often discharged into barrier-reef lagoons rather than into the open sea. Because very little mixing takes place and because tropical seawater is naturally nutrient-deficient, the eutrophication that occurs seriously disrupts the ecological balance. While several alternatives have been implemented--primary and secondary treatment of raw sewage, further treatment to remove soluble inorganic phosphorus and nitrogen,

LIBRARY U. OF I. URBANA-CHAMPAIGN

package treatment for sewage from recreational 'tourist' areasn-a new suggestion has been proposed. This is the concept of discharging treated sewage effluents, particularly the nitrogenous portion, into a mangrove-bounded estuary. A mangrove environment is naturally rich in organic material so that increased organics are not as disruptive as in the organically poor lagoon and reef. The mangrove area, which is common to many tropical regions, may act as a tertiary treatment site and discharge point. Simple retaining ponds in mangrove areas may then result in an effluent with large fractions of inorganic nutrients removed. Costs of building outfall pipes to sea may also be eliminated. Identifiers: Marine disposal, Stress evaluation for submergence in marine environments (SESME).

A 1670-foot, 24-inch diameter municipal outfall of polyethylene pipe was installed to replace a deteriorated line at Powell River, British Columbia. Because the line discharges its wastes 200 feet below the surface, stresses that would be imposed on the large-diameter pipe had to be evaluated before construction. This was accomplished with a computer program called Stress Evaluation for Submergence in Marine Environments (SESME). It was found that excessive bending stresses could be eliminated by attaching cedar logs to the floating pipe; the logs were later salvaged once the pipe had been located on the ocean bottom. A polyethylene material was chosen for the outfall line in order to achieve maximum flexibility, particularly where the route followed the curvature of the terrain. Specifications for the line included: tolerances for minimum radius of curvature for the 15-degree bend in the line; maximum departure from design alignments; and requirements for ballast weights to provide negative buoyancy for the pipeline. The line was joined on shore, and then was laid on the sea bottom using a 'controlled sink' method, whereby water was allowed to enter the shore end of the pipe while displaced air was expelled from the other end. The pipe formed an S-type curve off the bottom to the surface, and held its shape as it sank toward the outboard end. When the outfall was in place on the ocean bottom, a mini-submarine was used for final inspection of the installation. (Kramer-FIRL)

Descriptors: *Waste disposal, *Organic wastes, *Sewage sludge, *Sewage effluents, Reclamation, Productivity, Crop response, Wind erosion, Pollution abatement.
Identifiers: *Land disposal.

Organic wastes can be used safely and effectively to increase soil productivity if proper precautions are taken concerning heavy metals, toxic chemicals, nitrate leaching, erosion losses, and undesirable odors. Average composition is given for animal wastes (dairy cattle, beef cattle, swine and poultry hens), sewage sludge and secondary sewage effluent. Farm manures contain the major nutrients in the most correct proportion for soil fertilization. They also decrease bulk density, increase aggregate stability, increase water intake rates, and help control soil erosion. Sewage sludges are effective in reclaiming such productive land as mine spoil banks, wastes from a soda glass factory, dune and dredged sands, and abandoned garbage dumps and sanitary land fills. There is also evidence that crop yield increases as the result of irrigation with treated municipal wastewater. Proper waste management measures must be taken to protect the environment. When applied at crop use rates and with proper soil management, most organic wastes present no serious environmental hazards and should be considered a resource that agriculture can very well use. LAND DISPOSAL OF LIVESTOCK WASTE,
Maryland Univ., College Park. Co-operative Extension Service.
H. L. Brodie, and J. T. Kennedy.
Agricultural Engineering Release No 54, Environmental Series No 5, Cooperative Extension Service, University of Maryland, College Park, 1972. 3 p, 2 ref.

Descriptors: *Water pollution, *Livestock, Lagoons, Erosion, Agricultural runoff, *Waste disposal, *Farm wastes, Waste water treatment, *Farm lagoons.
Identifiers: *Land disposal.

The production and waste management practices used by farmers determine the extent of water pollution caused by their animal production units. Land spreading of animal wastes is a very effective method of preventing water pollution because of the natural treatment process in the soil. Several means of applying the principle of intercepting and controlling surface and subsurface waters are listed. Watersheds are affected a great deal more by natural pollutants than by animal wastes which are properly spread on land where erosion is controlled. Crop rotation, strip cropping, pasture improvement and the growing of crops for protective cover are the most common erosion control procedures. A list of steps to take in the prevention of pollution from land disposal of livestock wastes is given. Alternate methods of land application during the fall are provided. The best way to judge application rate is from experience by considering slope, slope length, soil type and ground cover. Two obstacles to winter spreading are frozen soil and deep snow. During the winter if a good spreading schedule cannot be followed, the manure should be stored under cover. Additional information on managing lagoons to capture runoff and minimize overflow is provided. If animal production units are properly located and managed, groundwater problems are minimized. LAGOONS FOR ANIMAL WASTE DISPOSAL,
Auburn Univ., Ala. Cooperative Extension Service.
H. Watson.
Circular R-6, Auburn University, July, 1972, 12 p, 6 tab, 3 ref.

Descriptors: *Waste disposal, Lagoons, *Design, *Management, *Biochemical oxygen demand, Poultry, Livestock, *Farm wastes, *Farm lagoons, Waste water treatment.
Identifiers: Water volumes, Sludge removal, Lagoon overflow, Loading.

For several years lagoons have been used for the disposal of livestock and poultry manure with varying degrees of success. A lagoon's effectiveness is determined by its design, construction and management. The two major advantages of lagoons are: (1) the labor requirements are less than for systems where manure is spread on fields and (2) lagoons usually can be constructed at a low initial cost. There are three major disadvantages of lagoons. (1) Objectionalbe odors are sometimes present, (2) Improper construction c

present a possible source of ground and surface water pollution, and (3) Periodic sludge removal is required. The processes of three lagoon types, aerobic, anaerobic and mechanically aerated lagoone, are discussed. The location, size and construction are examined as important factors in lagoon design. Tables for BOD productions and surface area requirements, water volumes for various aerator sizes and for water volumes of various anaerobic lagoons are given. The operation and management of a lagoon are explained through the various loading methods, sludge removal and lagoon overflow. Some general management practices that should be followed are given. (Kehl-East Central Oklahoma State)

EFFECTS OF APPLICATION RATE IN DIRECT LAND DISPOSAL OF ANIMAL WASTES,
Kansas State Univ., Manhattan. Dept. of Agronomy.
L. S. Murphy, G. W. Wallingford, and W. L. Powers.
Journal of Dairy Science, Vol 56, No 10, p 1367-1374, October, 1973. 8 fig, 4 tab.

Descriptors: *Farm wastes, Effects, *Solid wastes, *Liquid wastes, Feed lots, Dairy industry, Soils, Chemical properties, Nitrates, Salinity, Phosphorus, Waste disposal, *Rates of application.
Identifiers: *Land disposal, Colloidal dispersion.

Land disposal of animal wastes is a viable solution to the water pollution problem, but this disposal must be done with care so that new pollution problems don't arise. Excess application of manure can cause excess salinity, nitrates, and/or phosphorus as well as colloidal dispersion. A literature review is given to show the beneficial and detrimental value of manure applications on crops and on soil chemical properties. It was concluded that disposal of both solid and liquid wastes should be accompanied by regular soil analysis to detect accumulation of waste components or reaction products which may be detrimental to both the soil and to underlying aquifers. SWINE MANURE LAND APPLICATION RATES.
Hog Farm Management, Vol 9, p 32-33, February 1972. 1 tab.

Descriptors: *Waste disposal, *Nitrogen, *Indiana, Water pollution, *Ammonia, Waste treatment, Hogs.
Identifiers: *Land disposal, *Loading rates, Salt buildup.

Land application of swine manure is recommended as a means of protecting surface and ground water from nitrogen phosphorus excesses, of removing bacteria and pathogens through the 'living filter' operation, of improving soil structure, and of least-cost disposal. Nitrogen should not be returned to the land in excess of crop use. The amount of manure per acre to contain this amount of nitrogen depends on the animal ration, the ammonia conversion and denitrification before application, the crop type, and the climate. Typical values for swine wastes on various crops in Indiana are tabulated. Salt buildup should also be considered. (East Central Oklahoma State)

INDUSTRIAL REFUSE INCINERATION IN THE ROTARY KILN (INDUSTRIEMUELL VERBRENNUNG IM DREHROHROFEN).
Umweltshutz-Staedtereinigung, Vol 12, No 6, p 159-160, June, 1975. 2 fig.

Descriptors: *Waste water treatment, *Industrial wastes, Chemical wastes, *Incineration, Plastics, Paper, Oil wastes, Air pollution, Standards.
Identifiers: Rotary kiln.

The synthetic leather manufacturing plant in Chropyne near Gottwaldov, Czechoslavakia, disposes of all solid and liquid wastes ranging from paper, plastic production wastes, and trash to solvents, old oil, aqueous dimethylformaide solution and sludges from electroplating by incineration in a rotary kiln. The kiln has been designed for a throughput of 200 to 570 kg/hr solid and pasty material. In the afterburning chamber, 200 kg/hr of liquid waste material can be burned. The waste gases from the incineration process are cooled to 300 C by injection of air and discharged through a stack. The waste gas volume was measured to be 15,000 cu m/hr. The waste gases contain approximately 500 mg dust/cu m, 100 ppm CO, between 20 and 100 ppm SO2, 80 ppm nitrogen oxides of which 0.5 to 3.0 ppm are NO2, and between 300 and 1100 ppm HCl. Although the waste gas quality does not meet the requirements of established guidelines, Czech emission limits are not exceeded. The kiln has been in operation for approximately 2500 hr without major problems. (Nave-FIRL)

CRITERIA DEVELOPMENT FOR NATIONAL DRINKING WATER STANDARDS,
Environmental Protection Agency, Cincinnati, Ohio. Water Supply Research Lab.
G. G. Robeck.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 1-9. 4 ref, 1 tab.

Descriptors: *Potable water, *Water quality standards, Mercury, Arsenic compounds, Phenols, Pesticides, Water quality, Water properties, Water quality control, Water treatment.

The selection of criteria and examples of adequate and inadequate bases for drinking water standards are considered. Factors affecting the establishment of standards are discussed, and reasons for selecting a constituent and its limit for drinking water standards are illustrated for mercury, arsenic, carbon chloroform extracts, carbon alcohol extracts, phenol, and several pesticides. Many of the criteria are based on limited data and analytical methods, and more research is required on the physiological effects, measurement techniques, and treatment of contaminants in order to develop creditable standards. (See also W76-00102) (Witt-IPC)

NEW ANALYTICAL TECHNIQUES FOR THE STUDY OF WATER DISINFECTION,
Alabama Univ., University. Dept. of Civil and Mineral Engineering.
G. P. Whittle, and A. Lapteff, Jr.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 63-88. 6 fig, 16 ref, 3 tab.

Descriptors: *Water analysis, *Disinfection, *Analytical techniques, *Chlorine, Manganese, Chemical reactions, Chlorination, Water quality, Chemical analysis, Color reactions, Water chemistry, Water treatment.
Identifiers: Choramine, Nitrogen trichloride.

The leuco crystal violet method proposed by Black and Whittle in Journal American Water Works Association, Vol 59, p 607-619 (1967), has been modified to determine concentrations of free chlorine, mono- and dichloramine, and nitrogen trichloride as high as 10 mg/liter Cl. The original method is based on the reaction of chlorine or iodine with N,N-dimethylaniline at pH 4 to produce a bluish-violet color with an absorbance peak at 592 nm. Details of the modified procedures are given. Mn(IV) interferes with the determinations. It is believed these new methods will prove useful in research studies to elucidate the chemistry of chlorine reactions and disinfection processes and in application to water and waste water chlorination practice. CHEMISTRY OF SULFUR SPECIES AND THEIR REMOVAL FROM WATER SUPPLY,
University of Southern California, Los Angeles. Environmental Engineering Program.
K. Y. Chen.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 109-135. 11 fig, 29 ref.

Descriptors: *Sulfur compounds, *Water treatment, *Water chemistry, Hydrogen sulfide, Sulfur, Sulfides, Oxygenation, Water supply, Aeration, Chlorination, Ozone, Oxidation, Water pollution sources, Water quality control, Water quality, Waste water treatment, Pollution abatement.
Identifiers: *Polysulfides, Thiosulfate, Chlorine dioxide, Potassium permanganate.

An overall review is presented of the chemistry of sulfur compounds in dilute aqueous solution as related to water treatment practices, with special emphasis on the removal of sulfides. The topics discussed include: equilibrium chemistry of sulfur species (elemental sulfur, hydrogen sulfide, polysulfides, thiosulfate) in aqueous solution; chemistry or oxygenation of sulfide; and the removal of sulfides from water supplies by aeration, chlorination, ozonization, and oxidation by potassium permanganate and chlorine dioxide. W76-00108

CHEMICAL FORMS OF ARSENIC IN WATER SUPPLIES AND THEIR REMOVAL,
Johns Hopkins Univ., Baltimore, Md. Dept. of Geography and Environmental Engineering.
J. F. Ferguson, and M. A. Anderson.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 137-158. 8 fig, 29 ref, 2 tab.

Descriptors: *Waste water treatment, *Arsenic compounds, Pollutants, Chemicals, Toxicity, Natural streams, Adsorption, Iron, Aluminum, Alkalis(Bases), Water pollution sources, Pollutants, Toxicity, Iron oxides.
Identifiers: Aluminum hydroxide.

This review covers the chemical species of As present in natural waters, the possible conversions between species, and the significance of species on As removal technology. Included are a discussion of the removal of different forms of As and a description of the results of experimental work on adsorption of As onto amorphous ferric and aluminum hydroxides. (See also W76-00102) (Witt-IPC)

EFFECT OF ALUMINUM(III) HYDROLYSIS ON ALUM COAGULATION,
Ohio State Univ., Columbus Water Resources Center.
A. J. Rubin, and T. W. Kovac.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 159-179. 10 fig, 24 ref.

Descriptors: *Titanium dioxides, *Coagulation, *Chemical precipitation, *Colloids, Hydrogen ion concentration, Water treatment, Water purification, Chemical reactions, Separation techniques, Hydrolysis, Water chemistry, Solubility, Turbidity, Water properties, Waste water treatment, Aluminum.
Identifiers: *Aluminum sulfate, Aluminum hydroxide.

As with other sols the stability of colloidal titanium dioxide is dependent on solution pH and aluminum sulfate concentration. At high pH the sol slowly coagulates. Above pH 6 it is stable in Al(III) solutions of concentration less than 8 times 10 to the minus 9th molar. This critical coagulation concentration is lower than has been reported for other sols. The left and right stability limits defining the zone of rapid clarification are identical with the solubility limits of aluminum hydroxide. Aggregation in the sweep zone is controlled by the parameters affecting the solutility of the hydroxide precipitate. (See also W76-00102) (Witt-IPC)
W76-00110

MODEL SAND FILTERS FOR THE REMOVAL OF COLLOIDAL MANGANESE OXIDES USING SELECTED CATIONS AS FILTER AIDS,
Wyoming Univ., Laramie. Dept. of Civil Engineering.
S. R. Jenkins, J. Engeset, and V. R. Hasfurther.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 181-199. 12 fig, 17 ref.

Descriptors: *Manganese, *Colloids, *Water treatment, *Filtration, Cations, Separation techniques, Water purification, Filters, Sands, Hydrogen ion concentration, Calcium, Ions, Sodium, Water pollution sources, Model studies, Oxides, Inorganic compounds, Water quality control, Waste water treatment, Pollutants.
Identifiers: Manganese oxides.

Previous work by other workers has indicated that the most predominant form of manganese oxides precipitated on oxidation of Mn(II) during treatment of manganese-bearing waters is a mixture of $Na_4Mn_{14}O_{27}$ and Mn_7O_{13} (delta-manganese oxides). The removal of these oxides from aqueous solution by filtration through sand columns was examined. The solutions were filtered at the rate of 2 gal/min/sq ft for 45 minutes, and the amount of delta-manganese oxides passing the filter was determined as a function of time. After the 45 minute filter run, the manganese oxide solution was removed, and the amount of delta-manganese oxides adhering to the sand was determined. The effects of pH, precoating, filtration rate, and cation on the effectiveness of the filter to remove the oxides were studied. The Ca ion concentration necessary to produce maximum removal of delta manganese oxide particles is stoichiometric with the concentration of delta-manganese oxides. The first concentration of Ca necessary to produce the maximum effectiveness is termed the maximum effectiveness concentration (MEC) of the filter aid. Differences in pH affected the MEC of Ca only slightly. Precoating the sand with calcium ion causes considerable change in the effectiveness of Ca in aiding delta-manganese oxide removal. If Na ion is used instead of Ca as the filter aid, the MEC of Na agrees well with values reported by others for aggregation of hydrophobic colloids. This aggregation is promoted by double-layer compaction rather than specific chemical interaction. (See also W76-00102) (Witt-IPC)

INTERACTIONS OF AQUEOUS CHLORINE WITH ACTIVATED CARBON,
Delaware Univ., Newark. Dept. of Civil Engineering.
L. L. Olson, and C. D. Binning.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 253-295. 15 fig, 53 ref, 5 tab.

Descriptors: *Chlorine, *Activated carbon, *Adsorption, *Water treatment, Water properties, Water purification, Water quality control, Temperature, Kinetics, Chlorides, Byproducts, Water pollution sources, Water pollution control, Chlorination, Disinfection.
Identifiers: Darco G-60, Nuchar C-1000N carbon, Elovich equation.

Aqueous chlorine solution and activated carbon were mixed at pH 10 and 5.5 in a Nalgene reaction chamber immersed in a water bath. At predetermined intervals, aliquots were removed and filtered, analyzed for chlorine and carbon-oxides, and passed through Darco G-60 and Nuchar C-1000N activated carbon. Adsorption capacities were determined by agitating 1 g of the carbon in 100 ml of 0.25 normal barium hydroxide for 48 hr, allowing the mixture to settle, and titrating the supernatant with 0.1 normal HCl. The rates of chlorine removal are determined and shown in plots. The data indicate that the removal of aqueous chlorine from solution using activated carbon is a two-stage process, each having a characteristic rate of removal. The removal of aqueous chlorine fits Elovich's equation. The effects of temperature, amount of chlorides and protons produced, production of by-products, and redosing on the rate of removal are also discussed. (See also W76-00102) (Witt-IPC)
W76-00114

DYNAMICS OF BREAKPOINT CHLORINATION,
Northeast Univ., Boston, Mass. Dept. of Civil Engineering.
I. W. Wei, and J. C. Morris.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 297-332. 18 fig, 12 ref, 3 tab.

Descriptors: *Chlorination, *Ammonia, *Water purification, Reduction(Chemical), Chlorine, *Water treatment, Chemical reactions, Hydrogen ion concentration, Kinetics, Disinfection, Water chemistry, Waste water treatment.
Identifiers: Chloramine.

A kinetic study of the redox reaction between chlorine and ammonia in dilute aqueous solutions with pH 6.7-7.2 at 5-20 C is described. The study focused on the dynamics of the process during the initial stages (in the first hour). The formation of chloramine was very rapid and its subsequent decrease fast in all instances. As soon as the free chlorine concentration became constant, the decrease of chloramine followed a first-order rate law. The analysis showed that the concentration of chloramine increased during the early stages of the breakpoint process, reached a maximum after several minutes, and the declined as the reduction of chlorine proceeded. The concentration of free chlorine decreased as HOCl reacted in the formation of chloramines and then reached a relatively constant level, in most instances, before completion of the breakpoint process. The rate of the overall breakpoint reaction, as measured by the rate of decrease of total chlorine, decreased as the pH decreased. (See also W76-00102) (Witt-IPC)
W76-00115

EQUILIBRIA IN AQUEOUS SOLUTIONS OF CHLORINATED ISOCYANURATE,
Lawrence Experiment Station, Mass.
J. E. O'Brien, J. C. Morris, and J. N. Butler.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 333-358. 9 fig, 6 ref, 4 tab.

Descriptors: *Aqueous solutions, *Chlorine, *Computer programs, *Water treatment, Water purification, Chlorination, Equilibrium, Water quality control, Chemical reactions, Water chemistry, Disinfection, Reservoirs, Hydrolysis, Bactericides.
Identifiers: *Cyanurates, *Isocyanurates.

A computer program has been developed for calculating all chemical species as a function of reservoir chlorine, total cyanurate, and pH from individual acidity and hydrolysis constants in solutions of chlorine and cyanurate. Although chlorinated cyanurates serve as a reservoir of free chlorine, bactericidal efficacy is more closely related to the relatively small fraction of free chlorine present at equilibrium. Therefore, the use of excessive cyanurate in an overly zealous attempt to reduce photolysis may repress free chlorine to the point of suppressing germicidal activity. For the same reason the continual addition of chlorinated cyanurates as a source of chlorine is not recommended because this will lead to buildup of cyanurate concentration. (See also W76-00102) (Witt-IPC)
W76-00116

EFFECTIVENESS OF HYPOCHLOROUS ACID AND HYPOCHLORITE ION IN DESTRUCTION OF VIRUSES AND BACTERIA,
Cincinnati Univ., Ohio. Dept. of Civil and Environmental Engineering.
P. V. Scarpino, M. Lucas, D. R. Dahling, G. Berg, and S. L. Chang.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 359-368. 4 fig, 8 ref.

Descriptors: *Disinfection, *Viruses, *Bacteria, *Chlorination, E. coli, Coliforms, Bacteriophage, Water purification, *Water treatment, Water pollution sources, Water quality control, Chlorine, Waste water treatment, Bactericides, Viricides.
Identifiers: *Hypochlorous acid, Hypochlorite, Poliovirus, Coxsackievirus.

The disinfecting ability of chlorine and chlorine compounds in the treatment of water and waste water has been known for many years. However, little information is presently available concerning the inactivation of animal viruses in water and waste water by chlorine and its compounds. The inactivation of DNA phages T2 and T5, RNA phages f2 and MS2, Escherichia coli ATCC 11229, and two animal viruses, poliovirus type 1 and coxsackievirus A9, at 5 C and pH 6 and 10 and free chlorine levels of 0.01-10 mg/liter was studied. The greater resistance of the two animal viruses compared to the faster kill exhibited by the four bacteriophages and the test bacterium points out that the use of coliphages and even an important member of the total coliform and fecal coliform groups, i.e., E. coli, as indicators of enteric virus pollution of disinfection water is of questionable validity. Inactivation of the animal viruses was more rapid at pH 10 where the free chlorine is in the form of monovalent hypochlorite ion rather than HOCl. (See also W76-00102) (Witt-IPC)
W76-00117

KINETICS OF VIRAL INACTIVATION BY BROMINE,
National Inst., for Occupation Safety and Health, Cincinnati, Ohio.
D. G. Taylor, and J. D. Johnson.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 369-408. 15 fig, 54 ref, 3 tab.

Descriptors: *Viricides, *Bromine, *Disinfection, Kinetics, *Water treatment, Water purification, Water pollution sources, Water quality control, Microorganisms, Waste water treatment, Viruses.
Identifiers: *Hypochlorous acid, *Hypobromous acid, *Nitrogen tribromide.

Hypobromous acid, molecular bromine, and nitrogen tribromide were tested at pH 4.5 and 0 C for their virucidal activity and compared to the activity of hypochlorous acid against the bacterial virus phiX174am3. The relative rates of virus inactivation are in descending order, molecular bromine, hypochlorous acid, hypobromous acid, and nitrogen tribromide, at a concentration of 1 micromole. (See also W76-00102) (Witt-IPC)
W76-00118

INACTIVATION OF VIRUSES AND BACTERIA BY OZONE,
Hadassah Medical School, Jerusalem (Israel). Environmental Health Lab.
E. Katzenelson, B. Kletter, H. Schechter, and H. I. Shuval.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 409-421. 8 fig, 10 ref.

Descriptors: *Viruses, *Ozone, *Bacteria, *Disinfection, *Water treatment, Water purification, Water pollution sources, Water quality control, E. coli, Coliforms, Chlorine, Microorganisms, Aquatic microorganisms, Bactericides, Viricides.
Identifiers: Poliovirus.

The inactivation of poliovirus type 1, coliphage T2, and Escherichia coli by ozone (0.01-2.5 mg/liter) at 1 and 5 C was studied. The results clearly show the effectiveness of ozone in inactivating microorganisms. Lower concentrations of ozone and shorter contact times are required than are needed with chlorine or other disinfectants. (See also W76-00102) (Witt-IPC)
W76-00119

THE EFFECT OF WATER TREATMENT AND DISTRIBUTION ON TRACE ELEMENT CONCENTRATIONS,
Pittsburgh Univ., Pa. Graduate School of Public Health.
J. B. Andelman.
In: American Chemical Society Symposium on the Chemistry of Water Supply, Treatment, and Distribution, April, 1973, Dallas, Texas, p 423-440. 30 ref, 12 tab.

Descriptors: *Trace elements, *Water treatment, *Water sampling, *Water distribution(Applied), Water supply, Diseases, Water quality standards, Public health, Municipal water, Potable water, Water quality, Sampling, Epidemiology, Water analysis, Water chemistry.
Identifiers: Silver.

LIBRARY U. OF I. URBANA-CHAMPAIGN

There is some epidemiological evidence relating the trace element content of municipal water supplies to chronic disease, especially cardiovascular diseases. At present, the evidence is quite inconclusive and the possible mechanisms are generally uncertain. A survey of community water supplies has shown that for all the trace elements for which there are mandatory U.S. Public Health Service standards, only silver is not found in distribution system samples above the maximum permissible concentrations. The concentrations of trace elements and their variations in raw water supplies are of prime importance in relation to the ultimate quality of the finished water reaching the consumer. Trace element concentration of raw water varies widely with geographic location and time. Water treatment can, in some cases, increase trace element concentrations in municipal water. The distribution process can also affect the concentration of trace elements. All these variables emphasize the need for a carefully designed sampling scheme in attempting to determine the concentrations of trace elements to which humans are exposed through their drinking water. The need to sample at the terminals of the distribution system, rather than at the treatment plant, is especially important. (See also W76-00102) (Witt-IPC)

A STUDY OF THE TREATMENT OF LAKE MICHIGAN WATER USING DIRECT FILTRATION,
Illinois Inst. of Tech., Chicago. Dept. of Environmental Engineering.
R. D. Letterman.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-245 768, $5.25 in paper copy, $2.25 in microfiche. Illinois Water Resources Center, Urbana, Research Report No 102, 1975. 102 p, 35 fig, 7 tab, 25 ref. OWRT A-062-ILL (5). 14-31-0001-5013.

Descriptors: Lake Michigan, *Filtration, Pilot plants, *Water treatment, Flocculation, Polyelectrolytes, Coagulation, Filters, *Pretreatment(Water).
Identifiers: *Direct filtration, *Filter beds.

The direct filtration process can be an effective and economical alternative to the conventional sequence of operations used for water clarification. In most cases, the process has been used to treat water with a consistently low turbidity. Its effectiveness in other cases, e.g., treating water from Lake Michigan, will require a thorough understanding of process behavior and control techniques. Pilot plant studies were performed using a constant-rate dual-media filter preceded by a pretreatment reactor in which a cationic polyelectrolyte coagulant was added. For each filter design and set of operating conditions there is an optimum distribution of deposit within the filter bed at run termination which maximizes the water production per filter run. The pretreatment conditions (the polyelectrolyte concentration and the mixing intensity and duration) can be used to maximize the water production per filter run and maintain an acceptable effluent turbidity. The pretreatment conditions determine the rate of clogging front advancement in the filter bed, which, in conjunction with the terminal headloss, determines the distribution of deposit within the bed at run termination.

WATER TREATMENT PLANT, CITY OF QUEBEC, CANADA,
Quebec City Water Board (Quebec). Water Div.
V. Paquet.
Journal of the New England Water Works Association, Vol 89, No 2, p 111-120, June, 1975.

Descriptors: *Water treatment, *Treatment facilities, *Screens, *Flocculation, *Filtration, Ozone, Odors, Tastes, Neutralization, Coagulation, Lime, Chlorine, Mixing, Settling basins, Color, Canada, Filter.
Identifiers: Mixed media filtration, Alum.

Treatment of water at the Quebec City Water Treatment Plant, Quebec, Canada, is described. Screening is performed through 8 mesh rotary screens at the water intake. Raw water is pumped into a pipe where chemicals, such as chlorine, alum, hydrated lime, and coagulant aids are added to extract color and earthy materials. Mixing is aided by the use of helico-agitators. Water then overflows into ribbon type flocculators. The heavy floc formed settles easily in a settling tank. Treated water from the settling tanks flows into a water canal which feeds 16 filters which have a filtration capacity of 3 migpd. The filters are multilayer type filters with gravel, sand, and anthracite. Filtered water is treated with ozone to eliminate tastes and odors. Prior to distribution, the water is neutralized with hydrated lime. Technical information is presented concerning nominal capacity, cost, electrical installation, mechanical installation, treatment, and, main characteristics of the water treatment plant. (Orr-FIRL)

IMPROVEMENTS TO NEW BEDFORD'S WATER SUPPLY,
New Bedford Water Dept., Mass.
E. E. Begin, and R. D. G. Monk.
Journal of the New England Water Works Association, Vol 89, No 2, p 145-160, June, 1975. 3 fig, 3 tab.

Descriptors: *Water supply, *Water treatment, *Potable water, *Treatment facilities, Reservoirs, Water supply development, Water works, Water requirements, Water sources, Administration, Massachusetts.
Identifiers: New Bedford(Mass).

Improvements to the water supply of New Bedford, Massachusetts, are necessitated by the fact that the old system has reached its limit of productivity. A decrease in water quality in recent years will be corrected by the construction of a treatment plant. The plant is designed to remove color, iron, manganese, taste, and odor. Chlorine disinfection and soda ash addition for corrosion control will be continued. A new raw water pipe will connect the existing transmission mains to the treatment plant. Pre-treatment will be performed in carbon contact, mixing and flocculation basins, followed by two-story sedimentation basins provided with mechanical sludge scrapers. The filters will consist of anthracite coal and sand, and have a filtration rate of 6 gpm/sq at 45 mgd. Alum and quicklime will be used for coagulation. Activated carbom will be used for taste and odor control. Potassium permanganate will be used as an oxidizing agent for the removal of iron and manganese. Total cost of the treatment plant will be $15.5 million. The municipal water reservoir has been covered. A new pumping station is designed to improve the existing high service facility. The main proble facing New Bedford is an inadequate water supply. Suggested plans for augmenting the supply are described. Completion of all phases of the improvement program will satisfy the requirements of New Bedford until the design year 2000. (Orr-FIRL)
W76-00206

ECONOMIZING IN DESIGN WITHOUT SACRIFICING QUALITY,
Whitman and Howard, Inc., Boston, Mass.
S. Medlar.
Public Works, Vol 106, No 6, p 96-98, June, 1975. 3 fig.

Descriptors: *Water treatment, *Potable water, *Treatment facilities, Filtration, Construction, Automation, Water distribution(Applied), Water pollution control, Massachusetts, Costs.
Identifiers: Automatic backwash filters, Chemical treatment, Fall River(Mass).

A new 24 mgd water treatment facility is being built at Fall River, Massachusetts. Past water treatment had been chlorination and sodium hydroxide treatment and did not consistently provide water which met U. S. Public Health Service drinking water standards. The new filtration plant was designed so as to minimize construction and operating costs without sacrificing water quality. Treatment consists of flash mixing, flocculation, sedimentation, and rapid sand mixing; basins for the first three steps are built beneath the ground so that tank roofs are a foundation for buildings housing equipment and an administration area. Water will flow by gravity from North Watuppa Pond to the treatment facility, where it is clarified. It is then distributed to rapid sand filters, which are of the automatic backwash type. After filtration, pH is adjusted for corrosion control, the water is chlorinated, and it enters a clear well to be pumped into the distribution system. Chemicals including liquid alum, liquid sodium hydroxide, chlorine gas, fluoride, polyelectrolyte, and powered activated carbon are fed automatically into the water, proportional to flow. A central control area, connected with alarm circuits to monitor key functions in the plant and the distribution system, is also described. (Kramer-FIRL)

EXPERIMENTS ON FLUID BED TREATMENT USING PETROLEUM-BASED SPHEROIDAL DUST COAL, (IN JAPANESE),
S. Atuta, and Y. Mori.
Journal of the Japan Water Works Association, No 489, p 39-60, June, 1975. 50 fig, 16 tab, 4 ref.

Descriptors: *Odor, *Activated carbon, *Water treatment, Pilot plants, *Treatment facilities.
Identifiers: Fluid bed process, Charcoal, *Japan.

Experiments have been made to solve an odor problem which occurs each spring and early summer at Imbanuma, the source of water for the Chiba Prefectural Waterworks Bureau, in Japan. Both laboratory studies and field surveys have been conducted. A recently developed method using a fluid bed process with high fluidity activated charcoal, was very effective. This process was less expensive and easier to control than the conventional fixed bed process. The new fluid bed system is being tested on a pilot scale and initial results are detailed. WATER-DISINFECTION CHALLENGERS NOW ON TAP,
L. J. Ricci.
Chemical Engineering, Vol 82, No 17, p 49-51, August 18, 1975. 1 tab.

Descriptors: *Water treatment, *Public health, *Ozone, Activated carbon, Potable water, Disinfection, Water purification, Treatment facilities, Irradiation, *Waste water treatment.
Identifiers: Chemical treatment, Ozonation, Chlorination alternatives.

Possible health hazards from chlorination disinfection of water as a result of the reaction of chlorine residuals with organic contaminants have been revealed. As a result, alternative methods of water treatment, including ozonization and irradiation, are being considered to remove the precursors of volatile organics. The advantages and disadvantages of activated carbon, ozone, alternativ

hemicals such as iodine, bromine, bromide chloride, and potassium permanganate, irradiation lone or with ozone, and ultraviolet radiation with ozone are discussed. Ozonization is the most successful alternative to chlorination and is widely sed in France, West Germany, and Moscow for otable water treatment. While ozonization roduces no chlorinated organics and provides ood disinfection, its dosage must be carefully nonitored for complete purification, as it leaves o residual for continued disinfection. In the Jnited States, the first large scale ozone plant to reat waste water will be operating by next year to rocess 4 mgd in Southern Trumbell County, Ohio. Smaller facilities in Woodlands, Texas; Springfield, Missouri; Estes Park, Colorado; and ndiantown, Florida have chosen ozone for waste vater disinfection. (Kramer-FIRL)

EXPERIMENTAL STUDY ON DIRECT COAGULATION FILTRATION METHOD. (CHOKUSETSU GYOSHU ROKA-HO NI KANSURU JIKKEN KEKKA),
S. Tsunoda, and Y. Aoyagi.
Suido Kyokai Zasshi, (Journal of Japan Water Works Association), No 486, p 2-10, March, 1975. 4 fig, 3 tab, 18 ref.

Descriptors: *Filtration, *Coagulation, Hydrogen ion concentration, Potable water, *Water treatment, Turbidity, Waste water treatment, Kaolinite.
Identifiers: Filtration mechanisms.

The effect of pH on the filtration mechanisms in a direct coagulation filtration method was studied experimentally. An artificially turbid water was prepared by dissolving 20 ppm kaolinite into drinking water, adjusting the solution pH, adding polyaluminum chloride or aluminum sulfate as the coagulation agent, and filtering by a sand column. The zeta potential between the top of the sand column and 20 cm depth from the top was measured in relation to the solution pH or the filtration time. When polyaluminum chloride was employed as the coagulant, the optimum pH for the coagulation filtration occurred at 4 to 5. This is not in the pH range shown to be for the strongest coagulation force, and the mechanism of the removal of suspended particles by the sand at this pH range was the sand covering action. The mechanism for the solution with a pH of 6 to 9 was a blockade type, since the coagulation force between the suspended particles and coagulant was greater, resulting in the formation of larger particles. For the aluminum sulfate experiments, the optimum coagulation filtering occurred at a pH of 6 to 6.5 and the mechanism was the sand covering type; however, the mechanism for the solution with a pH above 7 was a blockade type and the leakage of coagulated particles from the sand column occurred in a short time. For both coagulants the kaolinite concentration in the column effluent decreased to less than one ppm for their optimum pH conditions. (Katayama-FIRL)

UPFLOW FILTER FOR POTABLE WATER PRODUCTION,
Walk, Haydel and Associates, Inc., New Orleans, La.
B. J. Haney, and S. E. Steimle.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 101, No EE4, p 489-502, August, 1975. 6 fig, 4 tab, 33 ref, append.

Descriptors: *Potable water, *Water treatment, *Filtration, *Filters, Reliability, Operating costs, Efficiences, Surges, Chemicals, Turbidity, Coliforms, Operations.
Identifiers: *Upflow filtration, *L'Eau Claire Process.

The operational reliability of a patented upflow filtration system (the L'Eau Claire Process) for the production of potable water was investigated. The upflow unit was subjected to upset conditions that are critical in both downflow and upflow filtration. The L'Eau Claire system with effluent disinfection was an effective self-contained means of potable water production. Turbidity removal was very good. Effluent averages were consistently below the American Water Works Association goal of 0.1 Jtu. Substantial coliform reduction occurred; average effluent levels were consistently below 50 coliforms/100 ml. The filter operated at filtration rates greater than 6 gpm/sq ft and as high as 10 gpm/sq ft. The L'Eau Claire system will react consistently to upset conditions. A loss of chemical upset will result in elevated effluent turbidity and coliform values 15 minutes after the loss of chemical. Values will increase until the chemical feed is resumed. Efficiency will not be reduced as a result of the loss and subsequent resumption of chemical. Increased effluent turbidity and coliform values will occur with an air injection upset. Values will peak in the first 15 minutes of the upset. Power failure upsets will be more critical at the beginning of the cycle than at the end. Surge upset will cause small increases in effluent turbidity and coliform values. Recovery from all upsets will occur 15 minutes after the upset condition is removed. The L'Eau Claire system can result in operational and capital costs savings. (Orr-FIRL)

HIGH-RATE WATER TREATMENT: THE STATE-OF-THE-ART,
Virginia Polytechnic Inst. and State Univ., Blacksburg.
P. H. King, R. L. Johnson, C. W. Randall, and G. W. Rehberger.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 101, No EE4, p 479-488, August, 1975. 4 fig, 9 tab, 5 ref, append.

Descriptors: *Water treatment, *Filtration, *Hydraulic design, Economics, Water quality control, Treatment facilities, Virginia, Mixing, Flocculation, Sedimentation, Water softening, *Reviews.
Identifiers: *High-rate treatment processes, Hydraulic loading rates.

One of the major advances in water treatment technology has been the application of processes operating at substantially higher hydraulic loading rates than previously used. A survey was recently conducted by the ASCE-EED Committee on Water Purification of state regulatory agencies to determine the prevailing concept of high-rate water treatment and to determine their attitude toward the various methods presently used. Treatment processes considered include flash mixing and flocculation units, sedimentation basins, filtration, and softening. The large majority of the states which responded indicated favorable experience with high-rate treatment plants. Operating data from four high-rate water treatment plants in Virginia were studied. The water produced by each of these plants was consistently of high quality; no significant turbidity breakthrough occurred during the study. The Committee has concluded that a broader based concept of high-rate treatment that includes other units as well as filtration units needs to be developed. When designing a water treatment plant, the entire system, from rapid mix to final stabilization and disinfection, should be considered as a single entity to obtain the optimum and most economical solution for each plant. High-rate treatment should include realistic loadings on flash mixing, flocculation, and sedimentation basins, and on solids contact units as well as filtration units. The Committee concludes that there are economic advantages in high-rate treatment processes which can be gained without sacrificing the quality of the water produced. (Orr-FIRL)

FILTER PLANT MODIFICATIONS FEATURE WASTEWATER RECOVERY,
Robert and Co., Associates, West Palm Beach, Fla.
J. H. Weaver.
Public Works, Vol 106, No 8, p 66-68, August, 1975. 6 fig.

Descriptors: *Water treatment, *Treatment facilities, *Water supply, Reservoirs, Water shortage, Screens, Filters, Florida.
Identifiers: Tampa(Fla), Dual media filters, Mechanical sludge collectors.

Although the City of Tampa, Florida, is involved in a long range study of expanding its water capacity, it was decided that immediate steps should be taken to avoid problems in the event of prolonged periods of dry weather within the next two or three years. Three areas were identified that could provide quick solutions at the lowest cost: the potential raw water supply could be increased by lowering the reservoir intake; the direct loss of water from the system caused by wasting filter backwash into the river could be eliminated; and, the storage capacity and processing volume of the settling basins could be increased by modification of existing basins and building two new ones plus modification of filters. A new reservoir intake was installed about 5.5 feet below the level of the existing intake, adding about 572 million gallons of usable capacity. Improvements to the intake system included: trash rakes to remove debris from the trash bars; travelling water screens to remove finer particles not collected by the bars; and, vertical pumps that do not need priming. To increase the time between backwashing operations, all filters were converted to dual media (anthracite coal and sand). The duration of filter runs has been increased about 50%. The minimum hydraulic capacity has been increased from 2 gpm/sq ft to 3 gpm/sq ft. The filter backwash is now collected in an equalization basin and recycled into the system. Some of the older existing settling basins had a loss of capacity due to the build up of sludge deposits on the bottom. Mechanical sludge collectors were installed. These move continuously across the bottom of the basin, collecting sludge at one end where it is pumped to drying beds or into the sanitary sewer. (Orr-FIRL)

NEW WATERWORKS IN STOCKHOLM,
K. Baeckstroem.
ASEA Journal, Vol 48, No 2, p 27-34, 1975. 13 fig.

Descriptors: *Water treatment, *Treatment facilities, Automatic control, Control systems, Computers, Equipment, Instrumentation, Power operation and maintenance, Power system operation, Electric power, Electrical equipment.
Identifiers: *Stockholm, *Sweden.

A brief description is presented of the electrical power, process control, and computer equipment for the new East Norsborg Waterworks in Stockholm, Sweden. In the first stage, the waterworks has a capacity of 200,000 cu m/day, which will eventually be doubled. This is the first waterworks in Sweden to operate with an electronic operating system and computer control. Equipment for the power supply includes: switch gear; automatic change-over system; and power-factor correction. The speed of the raw water pump motors is controlled by means of three thyristor convertor cascades. The main control board is built from mosaic modules and includes the necessary instrumentation, controls, signalling devices, and mimic diagrams. Units for the electronic control of different process components include: operating and indicating modules; operating and indicating printed-circuit boards; and, motor starter groups in the switch-gear. The operating system incorporates integrated fault annunciator equipment; each fault is identified as to which object is faulty and what the type of fault is. To reduce the amount of work involved and speed up the restarting time, an automatic zero voltage system is provided which ensures that in the event of a loss of voltage certain valves are set to the positions which they should occupy during start-up. Rapid sand filters and aluminum sulfate dosage control systems are discussed. Automatic measuring systems monitor flow, pressure, level, energy, weight, concentration, turbidity, and pH. The computer system is reponsible for data acquisition, processing, storage, logging, process control, monitoring, alarms, and statistical processes. (Orr-FIRL)

STUDIES ON USE OF FLYASH IN CONJUNCTION WITH ALUM FOR COAGULATION OF TURBID WATER,
Calcutta Univ. (India). Dept. of Applied Chemistry.
M. Adhikari, S. K. Gupta, and R. D. Biswas.
Journal of the Institution of Engineers (India), Vol 55, Part Ph 2, p 33-36, February, 1975. 2 tab, 19 ref.

Descriptors: *Water treatment, *Coagulation, *Fly ash, Daphnia, Chemical precipitation, Water purification.
Identifiers: *Alum, Alum sludge.

An investigation was conducted to determine whether fly ash could be used alone or in combination with alum or alum sludge for the coagulation step in water treatment. River water samples were collected from the Ganges River (India) from a fixed depth of the basin throughout the representative seasons of the year. A sample of fly ash from a boiler plant was collected from the Palta Water Works. It was pretreated by washing with distilled water to remove free alkali and passing the dried mass through a 100 mesh sieve. Large, well formed flocs tended to settle well and removal of turbidity was satisfactory in the case of high turbidity water. The decrease in alum requirement with fly ash was small at lower levels of turbidity. Additions of sludge and fly ash were effective up to a certain concentration of ash. The order of the addition of the coagulant and the ash was a determining factor. Efficiency of coagulation was found to depend largely on the extent of dispersion. The joint influence of ash and sludge is more than an additive function. The recycling of fresh sludge and ash treatment in coagulation reduces the time of settling up to 33.33%, minimizes the problem of sludge disposal and decreases the cost of coagulant required. The most efficient bacterial kill was observed with a combination of sludge and ash. Fly ash also increases the removal of water fleas (Daphnia) by sedimentation and therefore reduces the load on the filtration units. The use of fly ash in combination with alum does impart some advantages from the point of view of efficiency of treatment and also results in cost savings because of reduced alum requirements. FLUORIDATION ANALYSIS: THE BOSTON STORY,
Boston Metropolitan District Commission, Mass.
J. J. Matera.
Journal of the American Water Works Association, Vol 67, No 8, p 459-462, August, 1975. 3 fig, 1 tab.

Descriptors: *Water treatment, *Fluoridation, Distribution systems, Mixing, Public health, Aqueducts, Reservoirs, Water quality control, Monitoring, Potable water, Massachusetts, *Treatment facilities.
Identifiers: Boston(Mass).

The objective in fluoridation of a water system is to achieve a concentration of residual fluoride ion in the range from 0.9 to 1.1 mg/liter consistently throughout the entire distribution system. The Boston, Massachusetts, Metropolitan District water supply system made an analysis of its distribution system in order to determine alternatives for fluoride injection and monitoring locations. Two alternative locations for injection points were identified: alternatives I, fluoridation of major distribution reservoir outlets; and, alternative II, fluoridation on the aqueducts from the water supply reservoirs. The advantages and disadvantages of each alternative location, based on consideration and evaluation of existing facilities at each site, are presented in detail. A schematic diagram is given of the aqueducts and storage reservoirs showing the alternative location of fluoridation points. Alternative II was chosen as the most feasible location. Alternative II requires one less chemical storage and feed building and monitoring station than alternative I. It also provides for better centralization of facilities for chemical delivery and system operation, control, and maintenance and provides the best opportunity for diffusion and mixing of the fluoride solution. CHICAGO'S SWITCH TO FREE CHLORINE RESIDUALS,
Chicago Dept. of Water and Sewers, Ill. Water Purification Div.
B. F. Willey, C. M. Duke, and J. Rasho.
Journal of the American Water Works Association, Vol 67, No 8, p 438-441, August, 1975. 2 fig, 15 ref.

Descriptors: *Water treatment, *Chlorination, *Distribution systems, Water quality control, Samples, Illinois.
Identifiers: Chicago(Ill), Free chlorine residuals.

Chicago, Illinois, practiced superchlorination prior to coagulation, sedimentation, and filtration followed by postchlorination and ammoniation as water entered the distribution system until January, 1973, when the filtration plants coverted to providing free chlorine residuals throughout the city. The results of the first year of operation are discussed. There were 70 more taste or odor complaints in 1973 than in 1972; only one person in 50,000 noticed the change enought to notify wa quality surveillance personnel. Average chlori residuals leaving the plant have been held close 0.75 mg/liter of free chlorine and 0.12 mg/liter combined chlorine. The city instituted an E ployees Sampling Program whereby frequent sa pling of home taps of scientific and technical p sonnel of the water department would be made increase the division's already established sa pling program. In 1973, an average of 741 samp per month were reported. Conferences held w the distribution division uncovered areas wh valve readjustment could improve flow patter Controlled-flushing of fire hydrants, and a p gram of more frequent surveillance has impro areas of low flow or dead ends. Descriptors: *Water purification, *Riv *Reverse osomosis, Polyelectrolytes, *Viru *Water treatment, Filtration, Coagulation, collection, Coliforms, Pre-treatment.
Identifiers: *f2 virus, Pressure filtration.

A field study was conducted at Fort Meade, M land, to investigate the capabilities of two w purification systems in removing coliform or isms and f2 bacteriophage from the water o Little Patuxent River. These purification sys were a prototype, 360 gph reverse osmosis w purification unit and a standard, 420 gph, v purification unit. From data gathered, it was cluded that both the prototype and the stan water purification unit were capable of effect reducing the concentrations in a natural wat coliform organisms and f2 virus to undetec levels. The prototype reverse osmosis operated with cationic polyelectrolyte addi prefiltration, and hypochlorination and the dard unit employed coagulation, diatomite f tion, and hypochlorination. Additionally, it found that dual-media pressure filtration a gal/min/sq ft, with cationic polyelectrolyte tion, used as pre-treatment with the reverse o sis unit, was capable of removing 99.99% added f2 virus from a natural water. Virus re in this operation was the same after filter r and following backwash with clarified or raw water. (Kramer-FIRL)

GIANT 1 472 ML/D WATERWORKS AT GARDEN REACH, CALCUTTA,
Calcutta Metropolitan Planning Organization (India).
R. N. Mukherjee.
Journal of the Institution of Engineers (India), Vol 55, Part PH2, p 43-45, February, 1975.

Descriptors: *Water treatment, *Water supply, *Treatment facilities, Coagulation, Flocculation, Filters, Potable Water.
Identifiers: Calcutta(India).

The Calcutta Metropolitan Planning Organization, India, found that existing water treatment facilities at Palta provide an inadequate water supply. A new facility, the Garden Reach Water Treatment Plant was proposed to serve the southern part of the Metropolis. The river Hooghly will be the source of water supply, with the planned construction of a dam (the Farrakka Barrage) to increase water quality and quantity. Treatment will consist of: presettlement of raw water for six hours in a raw water lake; prechlorination of the silted water to control bacteriological and algal growth; coagulation; flocculation and suspended solids; filtration through rapid sand filters; and post-chlorination. An underground filtered water reservoir of 82,000 cu m will receive filtered water. When completed, the facility will be the largest in Asia and will produce 1,472 Ml/d filtered water for Calcutta. WHY CHLORINATE,
British Columbia Dept. of Health, Vancouver.
G. Duffield.
Water and Pollution Control, Vol 113, No 8, p 27-28, August, 1975.

Descriptors: *Chlorination, *Disinfection, *Water treatment, *Groundwater, *Surface waters, Chlorine, Water pollution control, Monitoring, *Canada, Watershed management.

The use of chlorination is defended as a necessary method of water treatment in Canada. While other possible methods of disinfection--ozone, chlorine dioxides, or ultraviolet light--may be implemented, chlorine is the only one to leave a residual. Chlorine in a small fraction of a ppm amount will not protect a given system against massive infiltration, a cross connection, or a main break. However, the purpose of such a chlorine residual is to serve as an indicator that the system is in good condition. If a system is regularly monitored for the residual and if is found that the residual has at some point disappeared, then the cause of the irregularity should be investigated. The need for chlorination disinfection in a watershed is supported by the multiple uses of a natural body of water, whereby bacteria may enter into the system from an animal population or from the disposal of sewage. Groundwater sources should be chlorinated to protect against iron- or sulfate-reducing forms of bacteria which might cause undesirable tastes or odors, colored water, slime growths, or equipment corrosion. While a recent EPA report found 66 compounds in the New Orleans' water supply which are combinations of chlorine and organic chemicals, and may be carcinogenic, this argument is countered by the fact that there is not enough evidence that the drinking of chlorinated water causes cancer. Chlorine is argued to still be the best disinfectant available for water treatment and bacterial control. (Kramer-FIRL)

ACIDIFIED ALUM SLUDGE AND FLY-ASH AS ADJUNCT TO COAGULATION,
Calcutta Univ. (India). Dept. of Applied Chemistry.
M. Adhikari, S. K. Gupta, and R. D. Biswas.
Journal of the Indian Chemical Society, Vol 52, No 2, p 127-130, February, 1975. 4 tab, 33 ref.

Descriptors: *Water treatment, *Municipal water, *Flocculation, Bacteria, Coagulation, Sludge, Rivers, Potable water, Coliforms, Fly ash.
Identifiers: Sulfated sludge, Phosphated ash, India, *Alum sludge.

The possibility of using acidified alum-sludge and acidified fly-ash as adjuncts to coagulation in the treatment of river water for municipal supply, and their capability to reduce coliform bacterial count and algae population in the usual alum coagulation process was investigated. A comparison of actural alum requirements and those when it is used together with sulfated or phosphated sludge and with sulfated or phosphated ash was made. Sulfated sludge and phosphated ash reduced the settling time and floc formation by 33% and 50%, respectively. The application of these adjuncts was found to minimize the disposal problem and to reduce the capital costs of chemical treatment. Sulfuric acid treated sludge was the most effective adjunct for water in the higher turbidity range. Coliform counts were also successfully diminished in supply water and the flocculation of both phytoplanktons and zooplanktons usually present in river water was initiated. (Kramer-FIRL)

TREATMENT OF SURFACE WATERS FOR DOMESTIC SUPPLY (FELSZINI VIZEK KEZELESE IVOVIZ CELJARA),
Melyepterv, Budapest (Hungary).
A. Polhydy.
Hidrologiai Kozlony, Vol 55, No 6, p 245-250, June, 1975. 3 fig, 1 tab, 5 photos.

Descriptors: *Water treatment, *Treatment facilities, *Potable water, Surface waters, Water resources, Oxidation, Adsorption, Filters, Coagulation, Activated carbon, Ozone, Control systems, Instrumentation, Equipment, Foreign research, *Design, *Water supply.
Identifiers: *Hungary.

The use of surface waters rather than groundwater resources as a source of drinking water became prevalent in Hungary about 20 years ago. In order to obtain the same quality of drinking water as from groundwater, advanced treatment of the surface waters must be performed. The professionals engaged in water treatment design at the Melyepterv facility have developed the designs for ten major surface waters treatment plants, with capacities ranging from 5 to 200 thousand cu m/day. The raw water for domestic supply use is diverted from the Danube and the Tisza rivers. The treatment plants include advanced drum filters, complex chemical feeding devices, clarifiers and filters. Suspended and dissolved solids are removed by oxidation, adsorption, chemical coagulation, and filtration. The newest plants are also designed using ozone treatment and activated carbon filtration. Melyepterv has developed floating silt blanket clarifiers which are provided with multiple controls to manage difficult treatment problems. The large open filters employed are designed with corrosion resistant and economical filter bottoms and are equipped with electric controls. A high standard of operation at the treatment plants is facilitated by advanced instrumentation and laboratory equipment, by extensive remote controls, and by mechanical equipment which eliminates much of the physical labor. CONTROL OF SURFACTANT POLLUTION,
Palta Water Works, Barrackpore (India). Water Lab.
S. K. Gupta, R. D. Biswas, and K. Ghosh.
Indian Journal of Environmental Health, Vol 17, No 1, p 21-25, January 1975. 2 fig, 1 tab, 5 ref.

Descriptors: *Surfactants, *Water treatment, Rivers, Coagulation, Recycling, Waste disposal, Foreign research, Water pollution control, *Fly ash.
Identifiers: *Alum sludge, Chemical treatment, *India(Ganga River).

A method was investigated for the removal of surfactant pollution from river water by the application of prime coagulant alum together with either fly ash or alum sludge. Both alum sludge and fly ash from water treatment stations had been considered useless by-products which caused their own disposal problems. Experiments were performed on water samples from the Ganga River collected at the Palta Water Works, Barrackpore, India. These samples contained the anionic surfactants sodium dodecyl benzene sulfonate (NaDBS) and sodium dodecyl sulfate (NaDS) and the cationic surfactants cetyl trimethyl ammonium bromide (CTAB) and cetyl pyridirium chloride (CPYCl). The solutions of river water containing these surfactants were treated with variable doses of alum together with fly ash or alum sludge. The remaining surfactant concentrations were evaluated by the surface tension measurements at 30 C, representing the amount of surfactant absorbed. As was shown graphically, both fly ash and alum sludge, when applied together with the prime coagulant alum, were able to minimize the surfactant concentration in the river water samples. HOW CAN YOU COPE WITH SHORTAGES.
New York City Dept. of Water Resources.
J. T. Egan, and N. Nash.
Water and Wastes Engineering, Vol 11, No 11, p 50-52, November, 1974.

Descriptors: *Chlorine, *Water treatment, *Waste water treatment, *Alternative planning, Chemical engineering, Sanitary engineering, Sewage treatment.
Identifiers: Shortages, Standby systems, New York City, Sodium hypochlorite.

The problem of a chlorine shortage is compounded by several factors including: (1) disinfection must be continuous once it is begun, (2) a trace quantity of the disinfectant in the distribution system is generally required by health agencies, (3) chlorine feed equipment is not readily adaptable to use of

LIBRARY U. OF I. URBANA-CHAMPAIGN

other substances, and (4) the replacement of chlorine feed equipment with other mechanisms requires substantial periods of time. Short term substitutes are difficult to come by but long term solutions or back up units have some advantages. These are: (1) iodine, less reactive than chlorine, longer retention time of its residual and more effective against virus, but may have detrimental long term effects on pregnant women, infants and persons with thyroid disease. (2) ozone, effective but expensive to apply and potentially harmful, (3) ultraviolet radiation, effective for small scale systems but area necessary for large volume treatment is very large. Metal ions such as copper, silver, and mercury are expensive, potentially very harmful and are not recommended. Bromine produces irritating fumes and requires extra safety equipment. Potassium permanganate and hydrogen peroxide have long contact time and high dosages with only partial reduction or microorganisms. For sewage treatment chlorine is the best available until more is learned about ozone effects. Iodine, bromine, ultraviolet radiation, and chlorine dioxide are much less effective. Sodium hypochlorite, has been in use since 1964 in New York City, is useful and little elaborate equipment is necessary. However, the bulk necessary is large and the cost is twice that of liquid chlorine. (Bradbeer-NWWA)

RIVER QUALITY AND INDUSTRIAL ADJUSTMENT: A CASE STUDY,
Western Michigan Univ., Kalamazoo.
F. C. Emerson.
Environmental Affairs Vol 3, No 1, p 188-198, 1974. 21 ref. 2 tab.

Descriptors: *Rivers, *Water quality, *Michigan, *Pulp wastes, Pulp and paper industry, Pollution abatement, Water pollution sources, Wastes, Industrial wastes, Treatment facilities, Waste water treatment, Great Lakes Region.
Identifiers: Kalamazoo River(Mich), Waste paper, Writing paper, Printing paper.

The Kalamazoo River in Lower Michigan has several paper mills located adjacent to it or one of its tributaries and was considered the most polluted river in the state. The improvement of water quality in the river in the last several years has come about as a result of the construction of a municipal-industrial waste water treatment facility and a reduction in total waste load to the river by the paper mills. The latter was the result of mill closings, changes in production processes, better control of effluent discharges, and most of all, a decline in the use of waste paper for the production of writing and printing papers. (Witt-IPC)

WATER QUALITY-LIMITED APPROACH TO EFFLUENT REDUCTION IN PAPER MANUFACTURE,
National Council of the Paper Industry for Air and Stream Improvement, Inc., Kalamazoo, Mich. Central-Lake States Regional Center.
A. M. Springer, D. W. Marshall, and W. J. Gillespie.
In: Proceedings of the 29th Industrial Waste Conference, Purdue University, May 7-9, 1974. p 945-963, 7 fig, 8 ref, 18 tab.

Descriptors: *Water reuse, *Pulp and paper industry, *Waste water(Pollution), Water conservation, Recirculated water, Slime, Odor, Corrosion, Scaling, Biochemical oxygen demand, Water pollution sources, Water pollution control, Industrial water.
Identifiers: *Paperboard mills.

On the basis of a 13-mill survey (Conducted by the National Council of the Paper Industry for Air and Stream Improvement), it appears that combination paperboard mills can tighten their water systems to the level of 200-300 gal of effluent/ton of product without major difficulties. Beyond this level, problems such as slime, odor, corrosion, scale, product mottle, and plugging are observed. The loading of BOD as measured in terms of BOD discharged/ton of product produced can be significantly reduced with a water reuse program. (Sykes-IPC)

AN ASSESSMENT OF UNIVERSITY INTERDISCIPLINARY RESEARCH: THE WISCONSIN RIVER AND THE LOWER FRASER RIVER WATER QUALITY STUDIES,
British Columbia Univ., Vancouver. Westwater Research Centre.
A. H. J. Dorcey, and I. K. Fox.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 320-357, 1975. 3 fig, 1 ref, 2 append.

Descriptors: *River basin development, *Projects, *Water quality, *Management, Water policy, Research, Assessment, Decision making, Evaluation, Human population, Behavior, Social aspects, Feasbility, Standards, Wastes, Coordination, Universities, Pollution abatement, Planning, Economics, Mathematical models.
Identifiers: *Interdisciplinary analysis, *Wisconsin River, *Lower Fraser River(Brit. Columbia), Multi-disciplinary, Least-cost, Economic analysis, Policy analysis, Public involvement, Institutional arrangements.

Findings are reported from two large and complex interdisciplinary water research projects, one in Wisconsin River and the other in the Lower Fraser River. Both projects have been conducted under auspices of a unversity, have included participants from the physical, biological, and social sciences, and have provided an improved foundation for policy and institutional development for water quality management in these two rivers. Part I of this report defines some termiology that is used extensively throughout the paper and specifies the major premises which govern the authors' assessment. Part II is devoted to the Wisconsin River study and provides a broad outline of the nature of the project, how it was conducted, and what it did and did not accomplish. The Wisconsin River study focused upon a pollution problem along a 180 mile reach of the river, water quality degradation being largely a result of waste discharge by 15 pulp and paper mills. Among the study objectives was to determine the nature of least-cost systems for achieving specified patterns of water quality in the river and to compare these costs with those under existing policies. Part III characterizes the Lower Fraser Project, a more comprehensive undertaking than the Wisconsin River Project due to size of flow and amount of industry. Part IV is the authors' assessment which reflects their current thinking about what factors determine whether or not an interdisciplinary research project will be successful. DISCUSSION (OF, 'AN ASSESSMENT OF UNIVERSITY INTERDISCIPLINARY RESEARCH: THE WISCONSIN RIVER AND THE LOWER FRASER RIVER WATER QUALITY STUDIES,' BY A. H. J. DORCEY AND I. K. FOX),
Colorado Univ., Boulder. Inst. of Behavioral Science.
K. R. Hammond.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 358-363, 1975. 1 fig.

Descriptors: *River basin development, *Projects, Decision making, Water policy, Management.
Identifiers: *Interdisciplinary analysis, *Wisconsin River, *Human judgment, *Policy process, Rational policy.

The paper by Fox and Dorcey describes a valuable interdisciplinary project aimed at providing technical scientific data to aid decision makers to derive rational, infomred policies regarding management of the Wisconsin River. In order to influence public policy development, however, we need much more information about the policy-process itself. Specifically, we need to know much more about the role of human judgment in that process and most important, we must learn how to improve the competence of human judgment, so that rational means can produce rational policy. The present study provides an excellent example of an attempt to increase the interdisciplinary character of scientific and technical efforts in order to guide the policy-process in the direction of increased rationality. PROBLEMS IN INTEGRATING WATER PROGRAMS,
Environmental Protection Agency, Washington D.C. Office of Water Programs.
E. T. Jensen.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, paper No. 11202, Vol 101, No HY3, p 467-470, March 1975.

Descriptors: *Water quality, *Water quantity, *Management, *Programs, *Hydraulics, Water resources development, Water law, Water policy, Planning.
Identifiers: *Government agencies, Strategy, Fragmentation.

Water quality management was for many years considered to be an entity apart from other professional disciplines involved in water resource management. The recent national focus on water quality problems has resulted in the development of a nationally uniform body of law setting forth national goals, a detailed planning process, and mechanisms for implementing these plans. The national programs for water quality are unified and integrated at the state and Federal levels between state and Federal agencies. In contrast, however, the more general water resources programs are badly fragmented with diffuse national leadership and poor state/Federal communications. There is no uniform body of law for the quantitative use and management of our water resources. Massive reorganization of the Federal water resource agencies might (or might not) provide a better framework for the nation's water resource program. It appears that the Water Resources Council offers the best hope of program articulation at the Federal

evel. At the state level, the 'policy approach' now eing used by Virginia may be helpful, but additional experience will be necessary. (Bell-Cornell)

Descriptors: *Water resources, *Water quality control, *Regional planning, *Interstate commissions, Estuaries, Groundwater, *Delaware River Basin Commission, *Comprehensive planning, Management, Tidal waters, Pollution abatement, River basins, Standards, Streamflow, Regulation, Dissolved oxygen.
Identifiers: Administrative law, Sea water intrusion, Assimilative capacity, Sewerage regionalization, Salinity control.

The water quality control plan of the interstate Delaware River Basin is part of a multifunctional master plan for water resources conservation, development, and management in the 13,000-mile, four-state region. The master plan, or Comprehensive Plan, is required by the Delaware River Basin Compact and has the force of law. No project or development affecting the water resources of the Basin can be undertaken if it is in conflict with the Comprehensive Plan, which includes policies, standards, criteria, and general goals, as well as physical projects and facilities, deemed necessary by the Delaware River Basin Commission for the purpose of the Compact. The water quality plan is being implemented by the Basin community under the guidance and regulatory control of the Commission. Compliance is effected by: mandatory consultative planning between the Commission and sponsors of projects that may influence water quality; and formal detailed review of water-related projects before construction approval is granted by the Commission. OIL POLLUTION OF THE SEA AND THE PETROLEUM INDUSTRY (VERTIDOS AL MAR EN LA INDUSTRIA DEL PETROLEO),
J. Albaiges-Riera.
Quimica e Industria, Vol 21, No 3, p 249, 252-253, 255, 257, March, 1975. 3 fig, 4 tab, 9 ref.

Descriptors: *Waste water treatment, *Industrial wastes, Oil industry, *Water pollution control, Oceans, Water pollution sources, Environmental effects, Aquatic organisms, *Oil pollution, Separation techniques.

A detailed review is presented of the main causes of contamination of sea water by petroleum and petroleum products, the effects of such events, and measures taken to combat this pollution. The main causes of oil pollution are spills during transport and during offshore drilling, and dumping of industrial effluents into the sea from refineries. Surface and depth pollution, distrubance of marine ecology, proliferation of undesired marine fauna, and poisoning or flavor alteration of edible aquatic species are some of the environmental effects. Abatement measures include: processing of effluents; regulatory legislation for offshore drilling; greater precautions against accidental spills; introduction of air cooling and recycling processes; and, treatment of effluents by decantation, flotation, biological degradation, and other biological and physico-chemical methods. (Morrow-FIRL)

ARE DRILLERS LEGALLY RESPONSIBLE FOR GROUND WATER POLLUTION,
W. N. Walker.
Water Well Journal, Vol 24, No 3, p 31-36, March, 1975.

Descriptors: *Legal aspects, *Pollution, *Water wells, Adjacent land owners, Civil law, Judicial decisions, Water rights, Water law, Legislation, Groundwater.
Identifiers: Driller liability, Legal responsibility, Drillers.

LIBRARY U. OF I. URBANA-CHAMPAIGN

The types of events encompassed in this analysis are generally those where a contractor drilling a well on one piece of property is alleged to have caused pollution of a well serving a neighboring piece of property. This report is not intended to reflect the law of any particular state. It is designed as a research aid to acquaint the practitioner with the principles he should take into consideration in preparing his case and the arguments he is likely to face. Very few reported cases have been discovered dealing with water well driller's liability; most of those cited deal with oil and gas wells. Plaintiffs may seek to establish liability on any one (or more) of three grounds: negligence, liability without fault, and anti-pollution statutes. Each involves different elements and must be defended on different grounds. Each is discussed separtely. Plaintiff has a second burden in addition to that of proving breach of a duty, common law or statutory. He must also show that the defendent's (driller's in these cases) act was the proximate cause of the alleged injury. Trial tactics are suggested which defense counsel may wish to consider in suits brought against well drillers seeking recovery of damges for pollution alleged to rise of drilling operations. ANIMAL WASTE MANAGEMENT IN TEXAS: TESTIMONY PRESENTED TO THE SOLID WASTE STUDY COMMITTEE OF THE TEXAS HOUSE OF REPRESENTATIVES,
Texas Agricultural Extension Service, College Station.
J. M. Sweeten.
Memo AENG 6, 1972. 10 p.

Descriptors: *Farm wastes, *Texas, *Feed lots, *Cattle, Proteins, Recycling, Poultry, Water pollution, Dehydration, Fertilizers, Odor, Rates of application.
Identifiers: Land disposal, Building materials, Refeeding, Pyrolysis, Turkeys.

Beef feedlots account for 65 percent of the animal manure (dry weight basis) in Texas. Of the total tonnage, 70 percent is from lots which do not contribute to surface runoff under storms of less than once-in-25-years frequency. Other lots are being upgraded toward this goal. Land disposal provides fertilizer and soil conditioning benefits. No salt build-up occurs with application rates below 300-900 tons/acre. Land disposal of solid beef feedlot wastes at rates consistent with sound agronomic practice gives benefit-cost ratios of about 2:1 or 3:1. Other methods cited are conversion to a protein source by thermophilic bacteria (GE-Casa Grande, Arizona), conversion to building materials by mixing with glass and heating at atmospheric pressure to 300-400 degrees C and 3000-4000 psi, refeeding as a fermented mixture of manure and hay, and pyrolysis with ammonia recovery. Turkey feedlots contribute to water pollution. It is usual in Texas to move the pens rather than the manure, utilizing the fertilizer value of the manure where it falls. Caged layers produce a high-nitrogen waste. Dehydration and refeeding appear promising. A cautious approach to this solution is urged. Broiler manure has value as a fertilizer and in cattle feed rations. For dairy cattle and swine, liquid manure handling is usual. Odor problems arise. Lagooning provides little economic return. Slurry irrigation by pipeline and spray nozzle or by storage pit and honey wagon is recommended. (East Central Oklahoma State)

ENVIRONMENTAL PROTECTION GUIDELINES FOR DAIRIES,
Texas Agricultural Extension Service, College Station.
J. M. Sweeten.
March 14, 1975, 15 p, 7 fig.

Descriptors: *Legal aspects, *Regulation, *Dairy industry, *Waste management, *Texas, Permits, *Water pollution control, Air pollution control, *Environmental control, Water quality standards.
Identifiers: Runoff control, Sanitation.

Proper site selection and facility design can minimize the water and air pollution from dairies. State and federal pollution control regulations greatly influence the design of dairy waste management systems. Such requirements for Texas dairies are given and explained. The major requirement for dairies to obtained permits from the Texas Water Quality Board is that systems be provided to prevent discharge from the premises. Generally, two systems are required: runoff control and manure management. Recommendations for these systems are given. Federal water pollution control regulations are also discussed. The Texas Air Control Board under the State Air Pollution Control Program has the authority to regulate odors from all dairies in the State under a general nuisance regulation. Permits and other regulations are required by the Texas Air Control Board and are explained. Dairy sanitation is under the Texas State Department of Health and milk inspection units of major Texas cities. Requirements for sanitation are listed. General Permit Procedures are discussed. AGRICULTURAL RESEARCH CONCENTRATES ON FARM WASTE.
New Scientist, Vol 59, No 856, p 198, July 26, 1973.

Descriptors: *Farm wastes, Effluents, *Slurries, *Waste treatment, *Regulation, Economics, Reclamation, Water pollution, Water quality standards, *Biochemical oxygen demand.
Identifiers: *Great Britain.

Scientists in Great Britain are using straw, hessian sacking, and even hedge-clippings, all of which are freely available in large quantities on most farms, in an effort to cut the cost of farm effluent treatment and achieve the Royal Commission standards of BOD for effluent charges. The aim has been to concentrate on the most extreme of farm slurry problems. Effluent from animals is one of the biggest problems farmers have to face. There is legislation to clamp down on farmers' methods of disposal if pollution of the water or the air infringes the regulations, but with few inspectors to check on what is happening in rivers and streams the low is often broken. In Silsoe they treat slurry by mechanical separation of the solids content from liquid for easier handling and aerobic treatment of the liquid to kill the smell. The process and costs involved are discussed in detail. (East Central Oklahoma State)

**COMMERCIAL FEEDLOTS-NUISANCE, ZO
ING AND REGULATION,**
D. J. Paulsen.
Washburn Law Journal, Vol 6, p 493-507, 1967
ref.

Descriptors: *Farm wastes, *Feed lots, *Nuisance, *Zoning, *Regulation, Commercial, Agriculture, Air pollution, Water pollution control, Pests, Odor, Abatement, Livestock, Legal aspects.
Identifiers: Noise, Injunction.

Livestock feedlots are not public nuisances per se, but they may become nuisances by virtue of their operation or the manner in which they are kept. Each case must of necessity be decided by examination of all the facts and circumstances surrounding the particular alleged nuisance. Among the facts and circumstances to be considered are: the type of neighborhood, the nature of the complaint, the proximity of those alleging the injury, and nuisance frequency. The remedies for nuisance are damages at law and injunction or abatement in equity. Zoning and regulation by public agencies are methods used to control the location and operation of feedlots, but because most zoning laws and regulations are the product af agrarian oriented legislatures, feedlots have been exempted to a certain degree from zoning and regulation by statue. A trend is starting in the East, however, to consider commercial feedlots (As opposed to the usual farm feedlots) as being more in the nature of an industry. This impetus is expected to spread. (Ballard-East Central Oklahoma State)

STATE REGULATIONS PERTAINING TO LIVESTOCK FEEDLOTS,
Agricultural Research Service, Beltsville, Md. Agricultural Engineering Research Div.
W. F. Schwiesow.
Presented at 1971 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 7-10, 1971, Paper No. 71-919, 16 p.

Descriptors: *Regulations, *Feed lots, *Livestock, *Water pollution control, *Farm wastes, Water quality standards.

The need for water pollution regulation led to the establishment of water quality standards through the Water Quality Act of 1965. Through some rather unusual channels, the need to include the livestock feedlot industry became apparent. Investigations on fish kills and polluted streams established that feedlots and dairy farms were a major cause. A focus on livestock wastes as a pollution source drew attention to the need for changes in agricultural practices. This brought about livestock feedlots now being subject to water quality control regulations. Need for uniformity in these regulations is recognized and various reasons are given. A listing of state offices that may be contacted for additional information on such regulation is provided. (Kehl-East Central Oklahoma State)

COSTS OF CONTROLLING FEEDLOT SURFACE RUNOFF,
Utah State Univ., Logan. Dept. of Agricultural Economics.
D. B. Nielsen, and P. P. Olson.
Utah Farmer-Stockman, Vol 92, p 10-11, October 5, 1972. 1 fig.

Descriptors: *Feedlots, *Agricultural runoff, *Costs, *Utah, Runoff control, Pollution abatement, Government supports, Water pollution control.

Of the 31 feedlots in Utah capable of handling 1000 head or more, 26 were assessed in a study of runoff potential. It appears that an expense of 18 cents per head fed would be involved in correcting runoff conditions. Of the lots, 12 had no runoff problem, 6 needed minor improvements, 5 needed major improvements, and 3 would find it more economical to relocate. (East Central Oklahoma State)

NUISANCE LAWSUITS--NEIGHBOR VS. NEIGHBOR.
Succesful Farming, Vol 72, No 10, p 40, September, 1974.

Descriptors: *Legal aspects, *Waste treatment, *Waste disposal, Locating, Nuisance(Water law), Pollution abatement.
Identifiers: Bower vs. Hog Builders, Inc.

Even if a livestock operation is not large enough for a permit to be required, the operation can still get into trouble concerning animal waste disposal. If a nuisance (the use of land by one that unreasonably interferes with the enjoyment or use of another's land) is created, a nuisance lawsuit may be brought against the operator. An example of this is the Bower vs. Hog Builders, Inc. case. In this instance, the Hog Builders, Inc. began a swine breeding and feeding operation adjoining the Bower Farm fifteen years after the Bowers had established their farm. This swine operation allowed effluent to flow onto the Bower's farm causing fish kills, odor, a difference in drinking water, and an influx of rats and flies. The Bowers lawsuit was submitted to a jury, and the Bowers were awarded $46,200 actual damages and $90,000 punitive damages. Such lawsuits can be avoided by locating such operations away from others' homes, by proper zoning, through licensing laws, and through construction of adequate waste treatment facilities. (Merryman-East Central)
W76-00460

TEST WAYS TO REDUCE FEEDLOT POLLUTION.
Wallaces Farmer, Vol 97, No 8, p 50, April 1972.

Descriptors: *Feed lots, *Water pollution, *Groundwater, *Agricultural runoff, Slopes, Management, *Sampling, Basins, *Nebraska, Engineering, Caissons, Waste treatment.
Identifiers: *Sloping feed lots.

Management systems designed to limit runoff, handling manure, and consequently pollution of streams and ground water have been constructed and are under observation. These are new concepts of inexpensive runoff control from sloping feedlots. Cattle feedlots on slopes as high as 15% may become minimum polluters through the use of engineering and management. A feedlot near Omaha, Nebraska (On a steep 15% slope with one 350-ft contributing slope length above the lone basin) and another near Springfield, Nebraska (With 3 basins on a 6% slope, with contributing slope length of about 120 ft each) were studied. Soil manure materials carried with the runoff were deposited in basins. Basins provided opportunity for the settling of suspended solids. Water from the ponds was used to irrigate nearby croplands. Runoff-recording equipment and ground water sampling wells were installed on both lots. At Springfield, none of the ground water samples have exceeded 10 parts per million of nitrate-nitrogen, a figure the Public Health Service has set as minimum desirable limit in drinking water. (Cameron-East Central Oklahoma State)
W76-00461

BRAKING FEEDLOT RUNOFF.
Agricultural Research, Vol 19, No 2, p 5, February, 1971. 1 fig.

Descriptors: *Runoff control, *Feed lots, *Nebraska, Water pollution control, Groundwater, Sampling, Soil analysis.
Identifiers: Soil cores.

Two management systems that limit pollution of streams and groundwater from beef cattle feedlots are currently under development in Nebraska. Collection basins are utilized to trap the runoff. Runoff recording equipment and groundwater sampling wells have been installed at two test feedlots. At one feedlot, steel cased wells (Caissons) have been installed to a depth of 12 ft to allow a study of soil gases and pollutants moving downward under various conditions in the feedlot. Soil cores have been and are being taken for analysis. (East Central Oklahoma State)
W76-00462

ECONOMIC IMPACT OF SELECTED POLLUTION CONTROL MEASURES ON BEEF AND DAIRY FARMS,
Economic Research Service, Washington, D.C.
J. B. Johnson.
Agricultural Waste Conference Emphasis-Animal Waste, Kellogg Center, Michigan State University, East Lansing, May 22-23, 1974, p 31-43. 7 tab.

Descriptors: *Water pollution, *Regulation, *Permits, *Costs, Agricultural runoff, Feedlots, Dairy industry, *Michigan, *Water quality standards.
Identifiers: *Effluent guidelines, Land disposal.

The Environmental Protection Agency point source effluent guidelines are described in detail as they pertain to beef and dairy operations. Even the smaller dairy and beef feedlots (Under 1,000 animal unit capacity) may be expected to comply with effluent guidelines established by water pollution control agencies. Michigan and other states will have state administered, federally approved permit programs for point source dischargesrs. Feedlots and dairy farms with surface water control problems will receive permits for continued operation contingent on a specified time for taking corrective measures. The application of these effluent guidelines will have differential effects on capital outlay requirements and production costs, depending upon feedlot capacity or dairy herd size and the type of housing in use. (Cartmell-East Central Oklahoma State)

MICHIGAN'S ENVIRONMENTAL CONTROL PROGRAM AND ORGANIZATION,
Michigan Dept. of Natural Resources, Lansing. Environmental Protection Services.
R. W. Purdy.
Agricultural Waste Conference Emphasis-Animal Waste, Kellogg Center, Michigan State University, East Lansing, May 22-23, 1974, p 45-50. 1 fig.

Descriptors: *Michigan, *Water pollution control, *Air pollution, Eutrophication, Organizations, Environmental control.

Data on Michigan streams shows that a large majority are not experiencing water quality problems. Approximately 85 stream segments have known or suspected water quality problems from point source discharges. About half of the state's lakes may be experiencing eutrophication. This is a natural aging process which can be accelerated by man's activities. Michigan estimates about one third of its lakes to be over-fertilized from unnatural sources. In general, it was concluded, the water resources of Michigan are in good condition. The air pollution problem in the areas other than highly populated metropolitan centers are basically caused by emissions of air contaminants from industrial operations. The major contaminants for which there is concern are sulfur dioxide and suspended particulate matter. (Cartmell-East Central Oklahoma State)

Descriptors: *Pollution abatement, *Costs *Farms, *Government finance, *Cost sharing, Water pollution control, Farm wastes.

LIBRARY U. OF I. URBANA-CHAMPAIGN

The Federal Government shares the cost with farmers under the 1974 Rural Environmental Conservation Program and the 1973 Rural Environmental Assistance Program for carrying out pollution abatement practices on farmland. Both conservation programs are available to farmland owners throughout the 1974 year. Requests for cost- sharing must be filed and approved by the local county ASC committee before the practice is started. (Cartmell-East Central Oklahoma State)
W76-00474

EFFECT OF NUTRIENT INPUT REDUCTION ON THE EUTROPHICATION OF THE MADISON LAKES.
Wisconsin Univ., Madison.
W. C. Sonzogni.
Available from University Microfilms, Inc., Ann Arbor, Mich., 48106. Order No 75-5960. PhD Thesis, 1974, 420 p.

Descriptors: *Nutrients, *Lakes, *Phosphorus, Sewage disposal, Models studies, Effluents, Runoff, Wisconsin, *Eutrophication, Water pollution control.
Identifiers: Madison(Wisc).

Nutrient loadings have been estimated for each of the Madison (Wisconsin) lakes. It has been seen from current and historical data that phosphorus concentrations are reduced when sewage effluent is diverted from entering the lakes. This indicates that external inputs, rather than lake sediments, are the controlling factors in phosphate concentration. Sewage diversion around Lake Mendota in 1971 reduced the average annual phosphorus loading by about 20 percent. However, observation over a three year period showed that the effect of this diversion was obscured by yearly variations in loadings from other sources, such as runoff. Phosphorus accumulation rates per unit area of anoxic sediment in Lake Mendota were shown to be similar to rates for other eutrophic lakes. Linear models to predict the rate and extent of recovery of a lake following phosphorus input reduction were evaluated. A phosphorus residence time model may be used to predict the steady-state mean phosphorus content of the lake which will be reduced in direct proportion to the change in input. It was concluded that non-conclusive evidence exists for the increases in phosphorus levels in Lake Mendota. (Prague-FIRL)

PANEL ON DISCIPLINE SUMMARIES AN OUTLOOKS: INTERDISCIPLINAR PLANNING AND USE OF THE SYSTEMS CO CEPT IN PLANNING,
H. O. Banks.
In: Proceedings of the Conference on Interdiscip nary Analysis of Water Resource Syste University of Colorado, Boulder, June 19-2 1973. An American Society of Civil Enginee Research Activity, ASCE Project No 201.07/1 3.72-4, New York, NY, p 380-387, 1975.

Descriptors: *Water resources developme *Systems analysis, *Planning, Mathemati models, Governments, Coordination, Alternati planning, Comprehensive planning.
Identifiers: *Interdisciplinary plannir *Multiobjective planning.

A discussion is presented of interdisciplina planning and the use of systems analysis planning as related to the Conference on Int disciplinary Analysis of Water Resource Systen The Conference omitted consideration of int disciplinary planning and research by states a lower levels of government. Basically, int disciplinary planning should utilize the expert of the range of disciplines necessary to fully co sider all significant aspects of a given proble Throughout the real-world planning process, the must be continued interaction without compa mentalization among the disciplines, acting in co cert to achieve defined objectives. At the ve beginning, problems should be defined on an int disciplinary basis and possible alternati delineated. Systems analysis and modeling a considered tools of planning. The planner m define the problem, select the alternatives to evaluated, and formulate questions to be posed the systems analyst who will assist him. In or for future interdisciplinary planning to become reality at all levels of government, and in priva enterprise, more people must be trained in a convinced of the necessity for the approach. T social and natural sciences must be motivated become involved. Consideration of and reco mendations for necessary legal and institutio

nges are essential. Finally, future conferences uld consider resource management planning, ause water plans must be a part of an in- rated whole. (See also W76-00060) (Bell-Cor- l)

day's engineer may no longer be the central ire in planning. The Colorado conference has vided a deeper understanding of the nature of erdisciplinary problems in water resources. ecifically, we have made a number of important ievements: (1) a clearer perception of the sub- but meaningful difference between mul- sciplinary and interdisciplinary; (2) emphasis of evaluative core of the policy-making process; emergence of a remarkably honest insight into sociology and the behavioral aspects of group namics in interdisciplinary teams; and (4) exam- s of the actual achievements of interdisciplina- teams. Besides achievements made possible by erdiscplinary approaches, we have seen some the problems, i.e., in evaluation, team continui- and pressure on team members. In answering question of where we go from here, three jor issues must be stressed: (1) values; (2) the ure of planning; and (3) the distinction between erdisciplinary and interagency planning. These discussed, and several other miscellaneous is- s are considered, including the fundamental thodologies from each discipline, effective in- action between disciplines, and the genesis of erdisciplinary fusion. VERNMENTAL CONTROL OF LAND USE ARIZONA (PRELIMINARY DRAFT),
zona Environmental Planning Commission; l Arizona House of Representatives, Phoenix. Everett.
port to the Arizona Environmental Planning mmission, May, 1974. 306 p, 6 fig, 4 tab, 20 ref.

scriptors: *Land use, *Land development, ood plain zoning, *Water conservation, rizona, Land management, Flood control, Ir- ation districts, Drainage districts, Cities, deral Government, State Governments, En- onmental control, Municipal water, Air pollu- n, Planning, Zoning, Urbanization, Land ources.

s report identifies those government agencies all levels which have an impact on land uses, h public and private, in Arizona. Although deral agencies are discussed, emphasis is placed cities, counties, and state authorities. This re- t is intended to be a research document to ist the Arizona Environmental Planning Com- sion in preparing recommended legislation for the Arizona State Legislature. An analysis is made of the statutory authority various agencies possess over the many land uses. Included are sections covering floodplain management and floodplain zoning at the city and county levels. In addition, statutes are presented which govern irrigation, drainage, flood control, irrigation water delivery, multi-county water conservation, and other special state-wide districts. A brief survey of existing and proposed land use programs for other states is added. (Robinett-Arizona)

6B. Evaluation Process

INTERDISCIPLINARY ASPECTS OF WATER RESOURCES PLANNING AND MANAGEMENT,
American Waterways Operators, Inc., Washington, D.C.
J. R. Smith.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, June 19-22, 1973, University of Colorado, Boulder. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 1-22, 1975.

Descriptors: *Water resources development, *United States, *Economics, *Transportation, Industries, *National Water Commission, Water policy, Planning, Management, Governments, Benefits, Inland waterways, Flood control, Multiple-purpose, Evaluation.
Identifiers: User charges.

The final report of the National Water Commission, recently issued to Congress and the President, is judged herein to be a 'blueprint for the destruction' of our Nation's water resources program. Although the report contains good suggestions, it is feared that adoption of many of its recommendations would cause a drastic change in programs already proven successful, such as flood control; thriving programs such as inland water transportation would be overhauled, causing dangerous repercussions in industry and commerce. The basic assumption of the Commission's report is that water resources programs no longer serve valid national needs, the only benefits being economic benefits on the local level; therefore, the cost of providing these local benefits should be recouped by imposing charges upon local user entities whose benefits are immediate and direct, rather than upon taxpayers of the Nation whose benefits seem more remote and indirect. Discussed are recommendations concerning the transportation industry, i.e., the imposition of user charges on all carriers utilizing Federal waterways. Considered are the detrimental effects of these narrow-in-scope recommendations on local communities, on the movement of particular commodities, on regional economies, on the price of goods and services, and on employment. The author opts for the continuation of a sound water management approach to serve the needs of the public and industry, for which an extremely high degree of cooperation among the involved disciplines is essential. PANEL ON DISCIPLINE VIEWPOINTS AND POSITIONS: SOCIO-ECONOMICS,
Wisconsin Univ., Madison. Inst. for Environmental Studies.
E. L. David.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 23-40, 1975.

Descriptors: *Economics, *Water resources, *Planning, *Management, *Universities, Constraints, Resource allocation, Social aspects, Decision making, Mathematical models, Systems analysis.
Identifiers: *Interdisciplinary research, *Socio-economics, Opportunity costs, Non-market decisions, Public finance.

Economists are involved in water resources planning and management. An overview is given of the traditional interests of the economics profession, including a brief history of some economic thought appropriate to management problems. Then a more specific examination is made of the role of the economist in interdisciplinary research; considered is the importance of appropriate forms of organization in facilitating interdisciplinary research in universities. The most important and difficult decisions in water resources planning and management are non-market, primarily public finance, decisions. Economists have made progress in conceptualizing these problems, have been acutely aware of the trade-offs involved in all resource allocations, and have realized that the incidence of costs and benefits of non-market goods and services is open to subjective judgment. However, economists have failed to accept a number of challenges. They have been: spending too little time on problems of the open economy; ignoring the contributions of related social disciplines; failing to generate appropriate models and data to tackle relevant problems; and paying attention to general rather than partial theory. Economists do not work effectively enough on real-world problems due to a lack of experimentation and limited scale of research. Interdisciplinary research prospects and limitations in the university are considered. Overall, academic institutions possess the potential for exceedingly powerful research. The challenge is to re-orient the academic profession and the university organizational structure to facilitate this research. (See also W76-00060) (Bell-Cornell)

NORTH ATLANTIC REGIONAL WATER RESOURCES STUDY,
Corps of Engineers, New York. North Atlantic Div.
H. E. Schwarz, D. C. Major, and J. E. Frost, Jr.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 245-271, 1975. 10 ref.

Descriptors: *Water resources development, *Alternative planning, *Comprehensive planning, *Regions, *Social aspects, Management, Demand, Supply, Mathematical models, Economics, Regional analysis, Decision making, Methodology, Land resources, Cost-benefit analysis, Systems analysis, Optimization.
Identifiers: *Interdisciplinary analysis, *North Atlantic study, *Multiple-objective planning, Cost minimization.

The experiences of the authors are described during their participation in the North Atlantic Regional Water Resources Study (NAR), an interdisciplinary, multiple-objective planning effort. Discussed are the nature of the study and the techniques used. The NAR Study was a comprehensive, long-range planning effort to procure and document information for use by decision makers to guide the development of the Region's water and related land resources. A new procedure--multiple-objective planning--was introduced. Three objectives, and preliminary cor-

LIBRARY U. OF I. URBANA-CHAMPAIGN

responding programs, were chosen by the Coordinating Committeel-National Income, Environmental Quality, and Regional Development. Included among the techniques adopted were computerized demand and supply models, data accounting systems, and decision making procedures for choosing among alternatives. Multiple-objective planning for water resources, a generalization of the tradiational benefit-cost analysis, considers not only management and development alternatives, but also prevailing social preferences toward objectives. The presence of many disciplines together with new planning techniques appeared to increase the quality of the NAR Study products and the behavior skills and contributions of the participants. A water study should be interdisciplinary and organized so that the disciplines are arranged on a broad plane of equality in influencing the study. (See also W76-00060) (Bell-Cornell)

DISCUSSION (OF, 'NORTH ATLANTIC REGIONAL WATER RESOURCES STUDY,' BY H. E. SCHWARZ, ET AL.),
Bureau of Outdoor Recreation, Philadelphia, Pa. Northeast Regional Office.
J. D. Peine.
In: Proceedings of the Conference on Interdisciplinary Analysis of Water Resource Systems, University of Colorado, Boulder, June 19-22, 1973. An American Society of Civil Engineers Research Activity, ASCE Project No 201.07/17-3.72-4, New York, NY, p 272-280, 1975.

Descriptors: *Water resources development, *Long-term planning, Resource allocation, Constraints, Social aspects, Coordination.
Identifiers: *North Atlantic Study, *Multiple-objective planning, *Interdisciplinary analysis.

The North Atlantic Regional Water Resources Study is criticized and suggestions are made to improve the interdisciplinary water resources planning process. The NAR Study was a constructive step toward genuine interdisciplinary water resource planning. The techniques of the multiple-objective planning approach should be used as building blocks for future water planning. This multi-objective framework is not being used in two Level B Water Resources Council-administered studies in the North Atlantic Region. The state-of-the-art of interdisciplinary water resource planning fosters a lack of coordination between studies, and unfortunately, an attempt is made in these Level B investigations to found predictions of resource allocations on a data base which is not uniformly quantitative, comparative, or cohesive. In order for a framework study to provide effective guidelines for long-term planning, there must be a stronger tie than was evidenced in the NAR Study between accurate data projecting future social needs and accurate data defining future resource constraints. Otherwise, deriving efficient national income, regional development, and environmental quality planning alternatives for, say, the year 2000 can only be guesswork. Discipline and agency bias must be compensated for through control of the study and coordination of the participants. The plan formulation process should be initiated at the beginning of the study, not delayed until all the inventory data is gathered. Finally, more comments are given concerning: funding; leadership; agency appendices to the main study report; and plan implementation. (See also W76-00060) (Bell-Cornell)

ARIZONA ENERGY INVENTORY: A REPORT ON THE STATE'S ENERGY POSITION AND OUTLOOK TO 1985,
Arizona Univ., Tucson. Div. of Economic and Business Research.
H. J. Frank.
Arizona State Fuel and Energy Office, Phoenix, February, 1975. 114 p, 10 fig, 41 tab, 17 ref, 5 append.

Descriptors: *Arizona, *Hydroelectric plants, *Electric power, *Fossil fuels, *Future planning(Projected), Hydroelectric power, Powerplants, Electric powerplants, Electric power production, Electric power demand, Electric power industry, Thermal powerplants, Natural gas, Oil, *Energy, Planning.
Identifiers: Energy supply, Solar energy.

The contribution which Arizona's ene resources currently make toward meeting energy requirements of the state is limited hydroelectric power and coal. The largest hydropower generated from 51 units at 12 sit Known deposits of crude oil, natural gas a uranium are small and information on th sources is inadequate. Over 85 percent of t supplies consist of natural gas and petrole products, virtually all shipped in from neighbor states. Energy demand projections indicate t consumption in 1985 could be as much as 2 times the 1973 level if the historical growth tr continues. The major problem area will be the c tinuing decline in natural gas supplies, which is likely to be halted before 1980. To supplement natural gas shortage, Arizona should consider burning of coal in large industrial installatio support of gasification of coal and importation gas, construction of a major oil refinery in state, intensive exploration of possible geother sources, accelerated development of solar ene and energy conservation. THE HIGH PLAINS: PROBLEMS OF SEMIARID ENVIRONMENTS.
American Association for the Advancement of Science, Southwestern and Rocky Mountain Division, Committee on Desert and Arid Zones Research Symposium, Contribution 15, April 26-29, 1972, D. D. MacPhail, ed., Fort Collins, Colorado, 100 p. (1972)

Descriptors: *Semiarid climates, *Meteorology, *Groundwater resources, Wyoming, Nebraska, Colorado, Kansas, Texas, Wind velocity, Wind pressure, Weather modification, Cloud seeding, Droughts, Legal aspects, Water policy, Water utilization, Competing uses, Prior appropriation.
Identifiers: *High plains region, Plains.

A collection of papers presented at the American Association for the Advancement of Science, Committee on Desert and Arid Zones Research Symposium on the environments of the high plains. Major areas of discussion include a general overview of the high plains region, particularly in terms of future development and climatic problems. Weather phenomena and possible adjustments to weather problems of the region are discussed. Ground water sources, management, and diversion comprise another section. Land use problems, including predator control, effect of feed lots on the local environment, and waste recycling techniques are surveyed. A final section analyzes the alternative approaches to problems the region is now facing or will eventually face. (See also W76-00180 thru W76-00182) (Frondorf-Arizona)

LEGAL PROBLEMS AND SOLUTIONS TO SURFACE-GROUND-WATER MANAGEMENT,
Colorado State Univ. Fort Collins. Dept. of Economics.
G. E. Radosevich, and W. M. Sutton.
In: The High Plains. Problems of Semiarid Environments, Colorado State University, Fort Collins, p 32-41, (1972) 8 ref.

Descriptors: *Water management(Applied), *Prior appropriation, *Water law, *Water rights, *Conjunctive use, Semiarid climates, Groundwater resources, Colorado, Texas, New Mexico, California, Legal aspects, Water policy, Water utilization, Competing uses, Water resources, Water allocation(Policy), Surface-groundwater relationships, Legislation.
Identifiers: *New Mexico groundwater law, *Colorado water law.

The systems discussed concern legal schemes developed by Colorado and New Mexico for the purpose of administering to the conjunctive use problem along with a cursory examination of situations in Texas and California. The doctrine of prior appropriation is discussed in relation to its initial development in the western states for the purpose of controlling the appropriation of surface water to its evolution and modification to control the conjunctive use of ground and surface water. Western states are finally recognizing the intimate hydraulic connections of ground and surface water and the need to integrate their use with the one constant being the goal of maximum utilization. TRANSMOUNTAIN WATER DIVERSION FOR THE HIGH PLAINS,
Colorado State Univ., Fort Collins. Environmental Resources Center.
N. A. Evans.
The High Plains: Problems of Semiarid Environments, Colorado State Univ., Fort Collins, p 42-59, (1972) 7 fig, 2 tab, 8 ref.

Descriptors: *Groundwater resources, *Irrigation water, *Water transfer, *Inter-basin transfers, *Water supply, Colorado, Semiarid climates, Water management(Applied), Water policy, Water utilization, Competing uses, Water law, Water resources, Water allocation(Policy), Beneficial use, Imported water, Groundwater recharge, Saline soils, Saline water.
Identifiers: *Northern high plains.

If irrigation agriculture is to be expanded on a large scale, there are major advantages for it to be done in areas having long growing seasons and mild winters, such as the Southwest. Expansion there will be impossible in the future without importation of water. Two problems for irrigated areas are noted: (1) Diminishing water supply, particularly groundwater, and (2) Areas having salinity problems, both in soils and water supplies. The High Plains of eastern Colorado is suggested as a possible site as its economic health and ground water supply is projected for about 25 years. This region is extensively described and the inter-basin water transfer outlook for west to east importation is reviewed. (See also W76-00179) (Robinett-Arizona)

ARIZONA GROUND WATER LAW: THE NEED FOR LEGISLATION,
Arizona Univ., Tucson. Coll of Law.
R. E. Clark.
Arizona Law Review, Vol 16, No 4, p 799-819, 1975. 114 ref.

Descriptors: *Water law, *Water policy, *Water supply, *Water allocation(Policy), *Groundwater availability, Arizona, Legal aspects, Water rights, Water resources development, Prior appropriation, Water transfer, Competing uses, Planning, Water utilization, Water requirements, Reasonable use, Political aspects, Social aspects, Water wells, Groundwater mining, Overdraft, Well regulation, Water management(Applied).
Identifiers: Central Arizona project.

As a result of Arizona's non-management approach to groundwater, the state is very late in recognizing the long term importance of groundwater for all types of uses. The rate of increase of groundwater withdrawal and the existing conditions in central Arizona make it essential that appropriate legislation be enacted. Two proposals are outlined to provide a basis for complementary legislation and a state-wide water management plan: the registration of all wells except those certified to withdraw minimum quantities of water, and declaration of the entire state as a critical groundwater unit, prohibiting new withdrawals with exceptions for minimum withdrawals. (Robinett-Arizona)

AN ECONOMIC ANALYSIS OF THE PATTERNS AND TRENDS OF WATER CONSUMPTION WITHIN THE SERVICE AREAS OF THE HONOLULU BOARD OF WATER SUPPLY,
Hawaii Univ., Honolulu. Water Resources Research Center.
H-S. Oh, and H. Yamauchi.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-246 040, $5.25 in paper copy, $2.25 in microfiche. Technical Report No 84, December 1974. 97 p, 10 fig, 15 tab, 70 ref, 13 append. OWRT A-030-HI(3). 14-31-0001-3511.

Descriptors: *Water demand, *Pricing, *Water consumption, Urbanization, Conservation, Costs, *Hawaii, Water utilization, Water supply, Water users, Projections, Water conservation, Groundwater, Institutions.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Identifiers: *Economic analysis, *Water consumption patterns and trends, Honolulu(HI).

During the period 1960-1971 the average daily per capita use of water in the nine service areas of the Honolulu Board of Water Supply increased by about 27% from 139 to 177 gal (526 to 670 l). Wide variations, however, were observed over both space and time. Large variations are related to changes in construction activity. A steadily widening gap between summer and winter use, approximately a million gallons per year, is related to expanding outdoor sprinkling uses. Differences in single vs. multiple dwelling use patterns of water are also explained by difference in outdoor sprinkling uses. There is no evidence that residential and commercial water users have been responsive to water rate changes in the past. Large industrial users on the other hand appear to have responded to rate changes, but this responsiveness is closely associated with the availability of self-service wells which ultimately tap the same ground water source of the Board of Water Supply. The nonresponsiveness of commercial water users is due in part to central metering and payment of water bills. The quid pro quo feature of the 'price' concept is not directly applicable to the water users in most large commercial establishments. The same holds for large institutional facilities. Major implications of this study related to: (1) practical refinements of the requirements approach to projecting future water needs, (2) the serious institutional limitations in the use of pricing policy as a means of promoting water conservation although peak load pricing may be an effective way to reduce inequitable distribution of water supply costs, and (3) the crucial importance of institutions as a policy variable for bringing about better overall management of the groundwater resource.

WILL TEXAS HAVE ENOUGH WATER FOR THE ELECTRIC UTILITY INDUSTRY,
Texas Water Development Board, Austin. Operations Div.
B. Hoffman, and C. Chandler.
Water for Texas, Vol 4, No 12, p 5-9, December, 1974. 3 fig, 1 tab.

Descriptors: *Electric power plants, *Cooling water, *Industrial water, Cooling towers, Environmental engineering, Thermal pollution, Water conservation, Humidity, *Texas.
Identifiers: *Cooling ponds, Electrical consumption.

The effects of apparently dwindling fossil fuel reserves and rising fuel costs have been severely felt by the electric utility industry. The present concern over the availability of fuel supplies may give way to the concern for the availability of water to cool and operate these plants. At present, steam-electric plants account for over 96 percent of the power generated in the state of Texas. Steam-electric power plants must circulate large volumes of water through their condensers to remove waste heat. The water evaporated in this process is now over 90 percent of the water consumed by the electric utility industry. By the year 2000 projections place the use of water by Texas power plants at 1,340 to 1,785 million gallons per day. Internal cooling systems where surface water is passed through the cooling tubes and returned to a natural water body increase the rate of evaporation in the water body. External cooling systems which are more expensive to install, cool the water before discharge. In a low natural evaporation area cooling ponds could be used satisfactorily, and in very high evaporative areas, such as west Texas the wet cooling tower would be the least expensive and least wasteful. Identifiers: *Interdisciplinary planning, Lawyers, Political scientists, Sensitivity.

A review is presented of the kinds of help that can be obtained from persons trained in law and government and a warning to avoid past mistakes; considered are the form and function of the law and the role of the lawyer in water resources engineering and economics. Engineers and economists have often misunderstood the law, leading to less efficient projects and even to project failure. Recommended is the teaming-up of lawyer, engineer, social scientists, and scientist at the preliminary stages of project or proposal formulation. This is illustrated using an example water supply planning situation of the North Platte basin in Wyoming and Nebraska. In the final stages of plan implementation, the lawyer's skills as an advocator may be required; the lawsuit serves a useful and necessary function in situations where rights clash. Although similar, the work of the political scientist is more concerned with form, arrangements and processes than with the particular actions that most concern the lawyer. Leading more in the direction of optimization, perhaps the political scientist can do more with his institutions and advice to translate technical knowledge into actions which meet social goals than can new laws. The extent to which the lawyer and political scientist contribute effectively to project development depends upon the sensitivity of those in charge to legal and institutional problems. Recent work of the National Water Commission provides an example of such sensitivity, and lack of it. (See also W76-00060) (Bell-Cornell)

The Colorado River, the sole dependable w supply for an area of 244,000 square miles in ing parts of Wyoming, Colorado, Utah, New M ico, Nevada, Arizona, California, and Mexico been the cause of the greatest conflict over w in the American West. At the heart of the co is the fact that the river carries enough wate only a handful of cities, industries and farms. movement for the Colorado River Compac 1922 is traced, the complex legal and political tles that spawned the conflict and which con to influence the lives of Westerners today described. A major topic is federalism; the att of the Colorado Basin states to work out destiny in concert with the Federal Governme each side has sought to assert its supremac areas coveted by the other. Further eviden the important role played by Governme Federal, State and local - in the developme the West is discussed. Evidence is presente the Supreme Court in 1963 misread the hist record when formulating the landmark decisi Arizona v. California. The study confirms th portant role tradiationally assigned to Delph penter of Colorado in promoting the compac

. Ecologic Impact Of Water Development

NEL ON DISCIPLINE VIEWPOINTS AND SITIONS: ECOLOGY,
consin Univ., Madison.
. Reed.
Proceedings of the Conference on Interdisciplin- y Analysis of Water Resource Systems, versity of Colorado, Boulder, June 19-22, 3. An American Society of Civil Engineers earch Activity, ASCE Project No 201.07/17- -4, New York, NY, p 55-62, 1975.

criptors: *Ecology, Ecosystems, Environ- t, Decision making, Management, Systems lysis, Mathematical models.
ntifiers: *Environmental quality, Biological ductivity, Human adaptability, Energy flow, rmation, Interdisciplinary analysis.

logy in its purest, most traditional sense is the dy of living organisms and their relationship to h other and to their non-living surroundings. ent preoccupation with the preservation of en- nmental quality has caused a vast expansion in meaning of ecology. Strictly speaking, ecology ains as environmental biology, concerned with cting a better understanding of biological ductivity (earth's carrying capacity for man) human adaptability (man's tolerance of the en- nment he himself creates). But now ecology is ing from the recesses of academia into the real ld of action and decision making. Precision is ded; a major handicap to establishing ecology science has been the lack of a fundamental with which to work. Only recently has the cept of an ecosystem emerged; herein, living anisms and non-living substances exchange erials as a result of a common energy flow. The rmous variety in nature presents problems in tification. Thus, a simplified classification em has emerged in which organisms are ped as producers, consumers, or decom- ers. Following pathways of materials through successive steps in food chains and determin- the energy efficiencies through various trophic ls are the means of obtaining basic ecological rmation. Ecosystems lend themselves to ems analysis for inventory, description, and surement in simulation, prediction and op- zation studies. Large ecosystems require inter- iplinary analysis and a comprehensive land- e, management model involving both technological and engineering features. (See also W76-00060) (Bell-Cornell)

THE TERASSPERC-A PROPOSED SI UNIT FOR THE FREQUENCY OF RECURRENCE OF A HYDROLOGICAL EVENT,
Bradford Univ. (England). Dept. of Civil Engineering.
M. F. Baty.
Hydrological Sciences Bulletin, Vol 20, No 1, p 47-50, March 1975. 6 ref.

Descriptors: *Flood recurrence interval, *Hydrology, Dimensional analysis, Frequency.
Identifiers: *Terassperc, *Hertz, *International system units, Unit conversion, Hydrological events.

In seeking to use SI units in accordance with British policy, a new SI unit for the frequency of occurrence of a hydrological event was devised. The derivation of the unit from the six (Later seven) base SI units was given. It was shown that every 996,000,000,000,000'th second the annual event occurs with a frequency of 1 hertz. This is within 0.4% of 1000 million million seconds per hertz, or 1000 million million seconds squared per cycle. In other words it is a 1000 terassperc event. This is well within the inherent errors of statistical methods. Thus the event which occurs on average once in 1000 years would have a terassperc value of unity. The SI unit for daily would be 365,000 sq Ts, weekly 52,000 sq Ts, and monthly 12,000 sq Ts. It is a matter for discussion whether a special name might be given to the 1000 terassperc, or annual, value. The unit has the advantage that the value increases directly the more often the occurrence, instead of the inverse relationship encountered with in the use of return period. The value in the derived SI unit is numerically equal to one thousand divided by the return period in years. The 50 year flood is a 20 terassperc flood. (Lardner-ISWS)

WATER MANAGEMENT MODEL IN FLORIDA FROM ERTS-1 DATA,
Geological Survey, Miami, Fla.
A. L. Higer, A. E. Coker, E. H. Cordes, and R. H. Rogers.
Final contract report, 1975. 42 p, 20 fig, 1 tab, 18 ref.

Descriptors: *Water management(Applied), *Surface waters, *Remote sensing, *Satellites(Artificial), *Florida, Hydrologic data, Data collections, Methodology, Model studies, Rainfall, Streamflow, Water yield, Water levels, Lakes, Data transmission, Tracking techniques, Networks, Water supply, Water resources development.
Identifiers: *Southern Florida, NASA, LANDSAT.

A prototype data acquisition and dissemination network, installed and operated by the U. S. Geological Survey, is a viable approach for providing the near real-time data needed to solve hydrologic problems confronting the nearly 2.5 million residents of southern Florida. Water-stage

LIBRARY U. OF I. URBANA-CHAMPAIGN

and rainfall data from ground stations are transmitted from the Everglades via LANDSAT, previously known as ERTS (Earth Resources Technology Satellite), the NASA tracking stations, and the U.S. Geological Survey to the users in less than 2 hours, a significant improvement over conventional techniques requiring up to 2 months. LANDSAT imagery significantly enhances the utility of the ground station measurements. Water stage (Depth) is correlated with water-surface areas from the imagery to obtain water stage-volume relations in near real time for management decisions concerning the distribution of water to the people, fauna, and flora of southern Florida. SIMPLE METHOD FOR MEASURING RELATIVE HUMIDITY, WATER AND AIR TEMPERATURES WITHIN A FEW MILLIMETERS OF WIND-GENERATED WATER WAVES,
Naval Research Lab., Washington, D.C.
A. H. Schooley.
Journal of Physical Oceanography, Vol 5, No 3, p 519-522, 1975. 6 fig, 8 ref.

Descriptors: *Humidity, *Waves(Water), Water temperature, Air temperature, Winds, Laboratory tests, Evaporation, Turbulent boundary layers, Thin films, Diffusion.
Identifiers: *Thermister, *Relative humidity, Wet bulb temperature, Dry bulb temperatures, Turbulent diffusion, Laminar layer, Molecular sublayers, 16 mm cine film, Water-wind tunnel.

A very short time-constant thermister, mounted on a streamlined strut, was placed to measure alternately the water and air temperatures during the passage of wind-driven water waves in the laboratory. The results were preserved by using a high-speed recorder. A thin film of water was found to cling to the thermister upon emerging from a wave and its evaporation recorded the wet-bulb temperature, followed immediately by the dry-bulb temperature when evaporation was complete. Thus, the relative humidity within a few millimeters of the wavy water surface was determined. Under the set of conditions used, it was found that molecular diffusion is important in the first few millimeters from the actual water surface before the transition to turbulent diffusion predominates. Identifiers: *LANDSAT, ERTS-1.

At all levels of government there is an unprecedented demand for comprehensive, accurate, and timely information on the environment. As a result, new and greatly improved ways of obtaining environmental data are being developed to meet the demand. This article examines four developments that are transforming the entire field of environmental measurement: (1) spectroscopy, (2) satellite transmission of environmental data, (3) remote sensing, and (4) computerized data processing. A few examples for each development were described. (Sims-ISWS)

SMALL-STREAM FLOOD INVESTIGATI[ONS] IN MINNESOTA, OCTOBER 1958 TO S[EP]TEMBER 1973,
Geological Survey, St. Paul, Minn.
L. C. Guetzkow, and K. T. Gunard.
Open-file report, May 1975. 161 p, 8 fig, 1 tab.

Descriptors: *Flood data, *Small watersh[eds], *Minnesota, *Hydrologic data, Flood peak, F[low] discharge, Gaging stations, Rain gages, Rain[fall]-runoff relationships, Streamflow, Flow ra[tes], Basic data collections.
Identifiers: *Small streams(Minn).

A small-stream flood-investigation program [in] Minnesota was initiated in August 1958. This p[ro]gram was designed to provide flood data [on] streams having drainage areas generally less t[han] 50 square miles, placing particular emphasis [on] those less than 10 square miles. Present effo[rts] oriented toward the collection of hydrologic [data] that will form the basis for defining flood-frequ[en]cy characteristics and provide information [for] detailed hydrologic studies. Gages were insta[lled] at 159 selected sites over a period of 8 years (19[58]-65). Data collection has been discontinued at [25] sites because of unstable control conditions [or] highway relocations. Plans are to maintain the [ex]isting network of 124 stations until sufficient [data] are obtained to define regionalized flood-frequ[en]cy characteristics. Each station is equipped with [a] crest-stage gage, which records the peak st[age]. Discharge measurements are made throughout [the] range in stage to establish a peak-discharge r[ela]tion. To supplement the record of instantaneous peak discharges, 11 stations have also b[een] equipped with recording gages, from wh[ich] discharge hydrographs can be derived to show [the] total volume of runoff during floods. Most stati[ons] equipped with continuous recorders have had [au]tomatic tipping-bucket rain gages installed to [re]-

simultaneous records of water stage and
:ipitation. (WoodardiUSGS)

**OLOGIC MAP SHOWING SPRINGS RICH IN
RBON DIOXIDE OR CHLORIDE IN
LIFORNIA,**
logical Survey, Menol Park, Calif.
arnes, W. P. Irwin, and H. A. Gibson.
n-file map, 1975. 1 sheet, 12 ref.

criptors: *Water quality, *Springs,
lifornia, *Carbon dioxide, *Chloride, *Maps,
s, Chemical analysis, Hydrogeology, Geologic
ping, Geologic units, Water chemistry.

s map shows carbon dioxide-and chloride-rich
ngs in all geologic provinces in California. The
on-dioxide-rich springs issue mainly from
nciscan terrane; they also are rich in boron and
of the metamorphic type. Based on isotopic
, either the carbon dioxide or the water, or
, may be of metamorphic origin. Because of
magnesium values, the water of many of the
on-dioxide-rich springs is thought to have
ed through serpentinite. The chloride-rich
ers are most common in rocks of the Great
ley sequence. Nearly all are more dilute than
ent-day sea water. The similarity in isotopic
positions of the metamorphic carbon-dioxide-
water and the chloride-rich water may in-
te a similar extent of water-rock interaction.

criptors: *Hydrologic data, *Groundwater
urces, *Streamflow, *Water quality, *Kansas,
er yield, Aquifer characteristics, Groundwater
ement, Water-level fluctuations, Chemical
ysis, Water utilization, Water resources
elopment.
tifiers: Wallace County(Kan), Logan Coun-
an), Gove County(Kan).

This 2-sheet atlas presents information on the geology and water resources of a three- county area in west-central Kansas. The report is intended primarily as a guide to the availability of groundwater, which is the main source of supply for domestic, stock, industrial, irrigation, and municipal uses. During the 13-year period 1958-71, water levels generally declined 5 feet or less in Gove, Logan, and northern Wallace Counties but declined more than 30 feet in sourthern Wallace County. Hydrographs for observation wells show the effect of groundwater development on water levels. The Ogallala aquifer (The principal water-bearing unit) has a saturated thickness of as much as 300 feet, and commonly yields 500 to 1,500 gpm of water to wells. The average annual streamflow of the Smoky Hill River (The principal stream) at the east boundary of Gove County is estimated to be 50,000 acre-feet. Water from the alluvium and terrace deposits is very hard and of the calcium sulfate type, water from the Ogallala Formation is generally hard and of the calcium bicarbonate type, and water from the Dakota Formation is soft and of the sodium bicarbonate type. (Woodard-USGS)

WATER RESOURCES OF WISCONSIN-UPPER WISCONSIN RIVER BASIN,
Geological Survey, Madison, Wis.
E. L. Oakes, and R. D. Cotter.
For sale by USGS, Reston Va 22092 Price $2.25 per set. Hydrologic Investigations Atlas HA-536, 1975. 3 sheets, 16 ref.

Descriptors: *Hydrologic data, *Water resources development, *Maps, *Wisconsin, River basins, Surface waters, Groundwater resources, Water quality, Hydrology, Hydrologic budget, Precipitation(Atmospheric), Surface-groundwater relationships, Hydrogeology, Groundwater movement, Streamflow, Water yield, Aquifer characteristics, Water utilization, Water supply.
Identifiers: *Upper Wisconsin River basin.

This 3-sheet atlas describes the physical environment, availability, distribution, movement, quality, and use of water in the upper Wisconsin River basin as an aid in planning and water management. General information is presented from data obtained from Federal, State, and local agencies. New field data were collected in areas where information was lacking. The upper Wisconsin River basin is the headwaters of the Wisconsin River drainage and includes about 2,730 square miles in northern Wisconsin (Upstream from the gage on the Wisconsin River at Merrill). An additional 50 square miles of the basin lies in Michigan and is not covered by this report. The report area includes parts of Forest, Langlade, Lincoln, Marathon, Oneida, Price, Taylor, and Vilas Counties. The average annual budget for a 30-year period (Calendar years 1931-60) indicates that, of the 31.3 inches of precipitation on the basin, 12.4 inches left as streamflow. This flow was equivalent to 2,546 cfs, or 1,646 mgd. The largest quantity of water that left the basin was 18.9 inches of evapotranspiration. Single-year budgets are shown for the dry (1948) and wet (1951) years. (Woodard-USGS)

INDEX TO U. S. GEOLOGICAL SURVEY COMPUTER FILES CONTAINING DAILY VALUES FOR WATER PARAMETERS TO SEPTEMBER 30, 1971, NORTHEASTERN REGION,
Geological Survey, Reston, Va.
C. R. Showen, and N. G. Stuthmann.
Available from National Technical Information Service Springfield, Va 22161 as PB-222 423, $10.00 printed copy; $2.25 microfiche. Water-Resources Investigations 25-73, June 1973. 354 p, 7 fig, 2 tab.

Descriptors: *Data storage and retrieval, *Hydrologic data, *Surface waters, *Northeast U. S., Streamflow, Water quality, Water temperature, Basic data collections, Chemical analysis, Sites, Computer programs, Data transmission.
Identifiers: *Hydrologic data storage index.

This report contains lists of stations in the Northeast Region of the United States where the U. S. Geological Survey collects water data either on a continuous basis or at least on a daily basis. The files contain daily values for streamflow, reservoir levels or contents, water temperatures, specific conductance, sediment discharge plus data for several other quality parameters that are measured by means of monitoring equipment or result from analyses of samples collected on a daily basis. The stations are listed according to station number within each State. Also included are the available retrieval options, the machine-readable output options, user charges, and how to obtain the data. (Woodard-USGS)

GROUND-WATER LEVELS IN THE UNITED STATES, 1968-72: NORTHEASTERN STATES.
Geological Survey, Reston Va.
Supt. of Documents, GPO, Wash. D. C. 20402 for $1.75 Water-Supply Paper 2140, 1974. 207 p, 14 fig.

Descriptors: *Basic data collections, *Groundwater, *Water levels, *Water wells, *Northeast U. S., Connecticut, Delaware, Indiana, Maine, Massachusetts, Michigan, New Hampshire, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, Vermont, Well data, Observation wells.

Water-level measurements conducted by the U. S. Geological Survey (1968-72) from wells in 13 northeastern states are given in feet with reference to either mean sea level or land-surface datum. Mean sea level is the datum plane on which the national network of precise levels is based; land-surface datum is a datum plane that is approximately at land surface at each well. If known, the altitude of the land-surface datum above mean sea level is given in the well description. The heigth of the measuring point above or below land-surface datum is given in each well description. Water levels in wells equipped with recording gages are reported for every fifth day and the end of each month. Each well is identified by means of (1) a local number that is provided for continuity with older reports and for other use as dictated by local needs, and (2) a code number serves not only to identify the well but also to locate it as a point on a map. (Woodard-USGS)

Geological Survey, Reston, Va.
Supt. of Documents, GPO, Wash. D.C. 20402, for Price $2.65. Water-Supply Paper 2148, 1974. 348 p, 1 fig, 40 ref.

Descriptors: *Basin data collections, *Water quality, *Surface waters, *Colorado River basin, *Great Basin, California, Idaho, New Mexico, Utah, Wyoming, Streamflow, Sediment transport, Particle size, Chemical analysis, Inorganic compounds, Biological properties, Sampling, Sites.

During the water year ending September 30, 1969, the Geological Survey maintained 125 stations on 76 streams in the Colorado River Basin and the Great Basin for the study of chemical and physical characteristics of surface water. Samples were collected daily and monthly at 114 of these locations for chemical-quality studies. Samples also were collected less frequently at many other points. Water temperatures were measured continuously at 8 and daily at 51 stations. Daily water temperatures were measured at most of the stations at the time samples were collected for chemi-

LIBRARY U. OF I. URBANA-CHAMPAIGN

cal quality or sediment content. So far as practicable, the water temperatures were taken at about the same time each day. Quantities of suspended sediment are reported for 43 stations during the year ending September 30, 1969. Sediment samples were collected one or more times daily at most stations, depending on the rate of flow and changes in stage of the stream. Particle-size distributions of sediments were determined at 25 stations. The stream discharge for a composite sample is usually the average of daily mean discharges for the composite period. The discharge reported in the tables of single analyses are either daily mean discharges or discharges obtained at the time samples were collected and computed from a stage-discharge relation or from a discharge measurement. SURFACE WATER SUPPLY OF THE UNITED STATES, 1966-70: PART 2. SOUTH ATLANTIC SLOPE AND EASTERN GULF OF MEXICO BASINS--VOLUME 2. BASINS FROM OGEECHEE RIVER TO CARRABELLE RIVER.
Geological Survey, Reston, Va.
Supt. of Documents, GPO, Wash, D.C. 20402, price $6.35. Water-Supply Paper 2105, 1975. 797 p, 1 fig.

Descriptors: *Basic data collections, *Surface waters, *Streamflow, *Flow rates, *Southeast U. S., River basins, Florida, Georgia, Atlantic Ocean, Gulf of Mexico, Runoff, Discharge(Water), Gaging stations, Flow measurement, Average flow, Hydrologic data, Water levels, Lakes, Reservoirs.
Identifiers: Maximum discharges, Minimum discharges.

This report is one of a series of 37 reports presenting records of stage and discharge of streams, and of stage and contents of lakes and reservoirs in the United States during the 1966-70 water years; it contains the records for gaging stations and partial-record stations in the South Atlantic Slope and eastern Gulf of Mexico basins, Ogeechee River to Carrabelle River. This is one of the second series of water-supply papers to be published on a 5-year basis. The first series covered the 5-year period October 1, 1960, to September 30, 1965. The daily table for stream-gaging stations gives the mean discharge for each day and is followed by monthly and yearly summaries of total, average, maximum, and minimum discharges. (Woodard-USGS)

STATE OF ARIZONA WELL LOCATION MAP A-1, HOLBROOK AREA, PORTIONS OF APACHE, COCONINO, GILA, AND NAVAJO COUNTIES.
Arizona Oil and Gas Conservation Commission, 8686 N. Central Ave., Phoenix, June 1975. 2 tab.

Descriptors: *Maps, *Well data, *Wells, *Stratigraphy, Water wells, Drill holes, Oil wells, Test wells, Natural gas, Exploration, Helium, Stratigraphy, Geologic time, Hydrologic data, Arizona.
Identifiers: Well location maps.

The map shows the correct or near-correct location of the numerous wells drilled in the gross Hollbrook area in search of oil, natural gas, and helium; stratigraphic, potash, halite, and structural and hydrological information; and selected water wells. A table gives the well name and location along with the geologic age of the rock at the total depth. Records of these wells are on file in the office of the Arizona Oil and Gas Conservation Commission. Much of the information pertaining to wells drilled for oil, natural gas, and helium was abstracted from Arizona Well Information, Arizona Bureau of Mines Bulletin 185, 1972. Most of the data listed for wells drilled since June 1973 were abstracted from The Commission's publications, Arizona Well Information, Supplement 1, Report of Investigation Number 5, 1973, and Explanatory Text and Well-Data Tabulation accompanying Well Location Map Nine, 1975. (Robinett-Arizona)

STILLING BASIN DESIGN FOR LOW FROUDE NUMBER,
Illinois State Water Survey, Urbana.
N. G. Bhowmik.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY7, Paper 11448, p 901-915, July 1975. 11 fig, 20 ref, 2 append.

Descriptors: *Froude number, *Outlet works, *Hydraulic jump, *Settling basins, Laboratory tests, Design data, Spillways, Turbulence, Energy loss, Hydraulics, Momentum equation, Baffles, Depth, Tailwater.
Identifiers: End sills, Forced hydraulic jump.

Laboratory tests were conducted to investigate the possibilities of increasing the energy loss and shortening the required stilling basin length for the Froude number range of 2.5 - 4.5. Data were collected for both the ordinary hydraulic jump and the forced hydraulic jump. Jumps were forced to form by the addition of appurtenances, such as baffle blocks and an end sill. A set of appurtenances and geometrical arrangements were found which performed satisfactorily. Comparison of the test data for the forced hydraulic jump with the data from an ordinary hydraulic jump for the same Froude number showed that the energy loss was increased, the required downstream depth of water was about 5% less than the sequent depth, and the jump was formed in a much shorter basin. POINT SOURCE DISPERSION IN TURBULENT OPEN CHANNELS,
Bogazici Univ., Istanbul (Turkey), Dept. of Mathematics.
K. M. Atesmen.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY7, Paper 11413, p 789-799, July 1975. 12 fig, 7 ref, 2 append.

Descriptors: *Open channel flow, *Dispersion, Numerical analysis, *Fluid mechanics, Hydraulics, Turbulent flow, Distribution, Velocity, Mathematics, Analysis, Variability.
Identifiers: *Point sources, Concentration, Skewness.

The effect of the initial distribution of dispersant was investigated by obtaining solutions for different initial instantaneous point and plane source distributions. The governing equations were converted to a tractable system of moment equations which was solved by a numerical method for the zeroth, first, second, third, and fourth moments of the longitudinal concentration distribution. The initial instantaneous point source was located at 0, 0.25, 0.50, 0.75, and 1.0 fractions of the flow depth. During the initial period of dispersion, the convective transport produced a considerable deviation of the moments of the dispersing cloud from the Gaussian long dispersion time conditions. The longitudinal dispersion in a turbulent open-channel flow was found to be strongly dependent on the vertical location of an instantaneous point source. (Adams-ISWS)

HYDRAULIC MODEL STUDY OF A SETTLING BASIN,
Illinois State Water Works Association, Vol 67, No 7, p 367-372, July 1975. 7 fig, 2 tab, 2 ref.
H. W. Humphreys.
Journal American Water Works Association, Vol 67, No 7, p 367-372, July 1975. 7 fig, 2 tab, 2 ref.

Descriptors: *Hydraulic models, *Settling basins, *Laboratory tests, Water treatment, Model studies, Hydraulics, Tracers, Analytical techinques, Velocity, Instrumentation, Currents(Water), Current meters, Flow measurement, Distribution patterns, Spatial distribution, Temporal distribution, Prototype tests, Illinois.
Identifiers: Lithium.

Laboratory studies were performed on a scale model of a settling basin in the Central Water Filtration Plant, Chicago, Illinois. Study objective was improvement of flow conditions in prototype settling basins in order to improve quality of settled water applied to filters. The 1-to-24 scale model included the raw water supply channel, mixing basin with four end around mixing channels including paddle flocculators, upper and lower settling basins, and settled water collector. Model performance was evaluated by making slug tracer studies using lithium as tracer, measuring velocity distributions in upper settling basin, and taking time-lapse color photographs of dye advance in upper settling basin. Results showed model hydraulic performance was improved considerably after modifying with turning vanes in the 180 degree turn between the last two mixing channels. This modification reduced the range of peak tracer concentration at the five outlet valves in lower settling basin; however, tracer distributions at model outlet were not sensitive to modification. Upper settling basin velocity distributions improved significantly. Modification was recommended for installation in prototype. (ISWS)

FRACTURING IN THE ZONE AROUND A BLASTHOLE, WHITEPINE, MINNESOTA,
Bureau of Mines, Minneapolis, Minn. Twin Cities Mining Research Center.
D. E. Siskind, R. C. Steckley, and J. J. Olson.
Report of Investigations 7753, 1973. 20 p, 9 fig, 2 tab, 16 ref, append.

Descriptors: *Rock mechanics, Cores, *Wells, *Mining, Construction, *Explosives, Permeability, Porous media, *Minnesota.
Identifiers: Well stimulation, Blasting, Well rehabilitation, Well fracturing, *Blastholes, In situ mining.

The Burea of Mines has studied the fracturing and associated damage occurring in the vicinity of blastholes from five shots fired in the shale pillars in the White Pine copper mine, White Pine, Mich. Four types of explosives (AN-FO, commercial extra dynamite, ammonia gelatin dynamite, and a low-density, low-velocity permissible) were used. Cores were taken from the blast region and examined by ultrasonic and petrographic techniques. Pulse wave velocities were measured across the core diameters, and thin sections showing cracks and changes in lithology were examined in an attempt to establish zones of damage. Cores from the blast regions and areas near pillar free faces were found to have abnormally low pulse velocities. Petrographic study of the thin sections showed that the negative velocity anomalies were caused by cracks in the cores. Crushing and extensive fracturing prevented meaningful measurements on core fragments from the immediate blast vicinities. Compositional changes and other rock nonuniformities, such as joints and preexisting fractures, tended to mask detailed damage differences among the four explosive; however, the two most energetic explosives (extra dynamite and ammonia gelatin dynamite) produced damage zones two to three times as large as the AN-FO and low-velocity permissible explosives. LOOP-RATING CURVES FOR VARIOUS UNSTEADY FLOWS,
Geological Survey, Reston, Va.
C. Lai.
In: Hydraulic Engineering for Optimal Use of Water Resources (Program and Abstract Papers), Proc. of ASCE Hydraulics Div. 23rd Annual Specialty Conference, August 6-8, 1975, Seattle, Wash: American Society of Civil Engineers Pub, Session 5B, Paper No 1, 1975. 1 p.

Descriptors: *Mathematical models, *Unsteady flow, *Streams, *Estuaries, *Flow characteristics, Hydraulic design, Planning, Streamflow forecasting, Floods, Rainfall-runoff relationships, Tidal Streams, Rating curves.
Identifiers: *Loop-rating curves.

A basic mathematical model, which uses the method of characteristics to compute unsteady flows, has been modified to plot numerous 'loop-rating' (Stage-discharge) curves for a variety of unsteady flow simulations. The loop-rating curves for floods in upland rivers are similar to those from ordinary flood measurements, whereas, curves from tide- affected reaches are strikingly different, but they, in general, resemble mirror images of the flood loops. Among those curves generated within tide-affected reaches are a wide range of loop shapes, such as those exhibited near the mouth, in the zone of flow reversal, in the zone of unidirectional pulsating flow, and near the end of tidal influence. Another group of loops characterizes the flow in a waterway connecting two rivers, reservoirs, or seas. Another set of rating curves is obtained in a very long river reach in which the downstream part is tide-affected and the upstream part, though not tide-affected, receives flood flow. (Woodard-USGS)

HYDRAULIC JUMP IN A ROUGH CHANNEL,
Toronto Univ., (Ontario). Dept. of Mechanical Engineering.
H. J. Leutheusser, and E. J. Schiller.
Water Power and Dam Construction, Vol 27, No 5, p 186-191, May 1975. 10 fig, 11 ref.

Descriptors: *Hydraulic jump, *Air entrainment, *Channel flow, *Open channel flow, *Roughness(Hydraulic), *Boundary layers, Turbulence, Froude number, Supercritical flow, Laboratory tests, Analytical techniques, Aeration, Mixing, Potential flow, Flow, Hydraulics Inflow, Sluice gates, Flumes.
Identifiers: *Fully-developed flow, Quasi-potential flow.

A hydraulic jump with fully developed inflow (in which the boundary-layer thickness equals the depth of flow) is more turbulent and entrains more air than the classical jump with undeveloped or quasi-potential flow. Experiments were carried out downstream of a sluice gate in a horizontal, rectangular open channel flume to investigate the development of supercritical channel flow and the performance of hydraulic jumps with fully-developed inflow. Tests were run on four different roughness surfaces which covered the entire length and width of the channel. The experimental results indicated that non-dimensional conventional jump length decreases with an increase in relative roughness. It was shown that with an increase in relative roughness, there is: (1) a trend towards greater steepness of the upstream roller face, (2) an increase in sequent-depth ratio, and (3) an increased tendency for low Froude-number jumps to assume a wavy-surface profile. Roughness accelerates flow development and hence engenders the formation of hydraulic jumps which have very desirable properties as promoters of intense mixing and gas transfer. (Singh-ISWS)

MICHIGAN DEMONSTRATION EROSION CONTROL PROGRAM,
Michigan Dept. of Natural Resources, Lansing. Water Development Services Div.
W. D. Marks, and F. A. Clinton.
Shore and Beach, Vol 42, No 2, p 11-17, October 1974. 7 fig.

Descriptors: *Beach erosion, *Waves(Water), *Erosion, *Stabilization, *Shores, *Lakes, *Michigan, Lake Michigan, Lake Superior, Groins(Structures), Breakwaters, Cost analysis, Costs, Economics, *Erosion control, Shore protection, Projects, *Great Lakes.
Identifiers: *Rock revetments, Nami rings, Z-walls, Beach nourishment.

Various shore protection methods utilized by the State of Michigan, Department of Natural Resources, were described. Wind-generated waves in three of the largest Great Lakes in and around Michigan caused substantial erosional damages to the shores of these lakes and significant property losses. The objective of these demonstration projects was to test and recommend an economically feasible shore protection method which would cost an individual property owner about $50 per front foot of shoreline. Eighteen projects were described, including types of construction, materials used, unit cost and the effectiveness of the protective measures. Methods used to protect shores were: rock revetments, timber groins, gabion groins, Dura Bags, breakwater, Z-wall, Longard tube, asphalt mastic covered rock groin, sand filled nylon bags, beach nourishment, Nami Rings, and combinations of these methods. Filter cloth, rock filters, and sand filters were also used with these various methods. Cost varied from $21 to $72 per front foot of the shoreline. Evaluations of a few of the methods were not presented because they were constructed only a short time before publications. (Bhowmik-ISWS)

THEORY AND APPLICATION OF THE SKIN EFFECT CONCEPT TO GROUND WATER WELLS,
Maryland Univ., College Park. Dept. of Civil Engineering.
Y. M. Sternberg.
In: International Symposium on Development of Ground Water Resources, November 26-29, 1973, Madras, India, Vol 2, p III 23-III 33, 1 tab, 10 ref, append.

Descriptors: *Drawdown, *Water wells, *Hydraulics, Flow, *Groundwater movement, Yield equations, Productivity.
Identifiers: *Skin effect, *Productive capacity, *Pressure build-up, Radial flow, Pressure distribution.

Field analysis have shown that a zone often exists in the vicinity of a well bore whose permeability is substantially lower than that of the rest of the formation. The increased head loss or pressure drop that results from the lower permeability is termed the skin effect. Though a method for determining the skin effect from recovery or pressure build-up data of the pumped well is applicable to oil wells, water wells normally exhibit a very rapid build-up or recovery curve once the well is shut off and the skin effect cannot be readily determined. Two unsteady state flow equations are formulated and solved for a well where the skin effect is present and are compared with good agreement. In the first, permeability near the well decreases with drawdown and time due to migration of fines, and incrustation. The two regions are uniform but different. In the second model that equation for drawdown distribution due to a fully penetrating well in a confined aquifer is modified by the addition of a head loss under steady state conditions. A table comparing the solutions of these two equations is presented. (Bradbeer-NWWA)
W76-00399

PARTIALLY PENETRATING WELL IN A CONFINED AQUIFER,
Osmania Univ., Warangal (India). Regional Engineering Coll.
P. G. Sastry, and P. Prakasam.
In: International Symposium on Development of Ground Water Resources, November 26-29, 1973, Madras, India, Vol 2, p III 33-III 42, 7 fig, 8 ref.

Descriptors: *Water wells, *Aquifers, *Penetration, *Discharge(Water), Well spacing, *Groundwater movement, Wells, Aquifer properties, Hydraulics, Water yield, Confined water, Base flow.
Identifiers: *Partially penetrating wells.

A critical review of the existing methods to analyze the flow toward a partially penetrating well in a confined aquifer is made. The method of electrical analogy is employed to analyze the flow towards a partially penetrating well in a confined aquifer. The effect of penetration fraction on the discharge and additional drawdown is significant. The increase in penetration does not give rise to a proportional increase in yield. This is especially true beyond a penetration of half the aquifer thickness. The discharge ratio increases with increase in the ratio of radius of influence to well radius. The ratio of the aquifer thickness to the radius of influence is inversely related to the discharge ratio, though it is less significant than the previous parameters. The effect of partial penetration is less pronounced in wells of a larger radius. Finally, a drop in the discharge can be observed for the same penetration when the aquifer thickness is large compared to the well radius. The results of the tests conducted on this study are in support of Wen Hsiung Li's and Muskat's investigations. (Bradbeer-NWWA)
W76-00400

STUDIES ON A WELL PENETRATING A TWO-AQUIFER SYSTEM,
Indian Inst. of Tech. Madras.
M. H. Abdul Khader, K. Elango, M. K. Veerankutty, and G. Satyanandam.
In: International Symposium on Development of Ground Water Resources, November 26-29, 1973, Madras, India, Vol 2, p III-43-III-52, 5 fig, 1 tab, 4 ref.

Descriptors: *Aquifer systems, *Groundwater, *Discharge(Water), Continuous flow, Performance, Efficiencies, Evaluation, Resistance, Networks, Model studites.
Identifiers: *Two-aquifer system, *Multi-aquifer systems.

A theoretical formulation for the analysis of a well, penetrating a two-aquifer system with an unconfined aquifer at the top and a confined aquifer at the bottom is presented. The steady state performance characteristics of this system have been studied on a sand model, including the testing of each aquifer separately, and together at varying pump rates. An interference coefficient of discharge is defined and its values are determined from experimental data for different driving head conditions in the two aquifers. The values of the interference coefficient of discharge vary from 10 to 25 percent. This indicates the significance of the interference effects in a two aquifer system. (Bradbeer-NWWA)

SEEPAGE IN WELL SYSTEMS NEAR A BARRIER BOUNDARY,
Osmania Univ., Hyderabad (India).
D. B. Rao, and
In: International Symposium on Development of Ground Water Resources, November 26-29, 1973, Madras, India, Vol 2, p III-53-III-65, 6 fig, 3 ref.

Descriptors: *Drawdown, *Forecasing, Planning, *Well spacing, Mathematical models, Barriers, Hydraulics, Wells, *Seepage.
Identifiers: Drawdown patterns, Well location, Coefficient of interference, Drawdown ration, *Barrier boundaries.

Based on the principle of superpostion and the method of images a mathematical technique is developed to obtain the transient drawdown in the vicinity of well groups located near a barrier boundary. A straight line array of wells penetrating a phreatic aquifer is considered. Each well in the array is assumed to discharge at the same rate. Solutions are obtained using a digital computer to evaluate the exponential integral. In order to generalize the results, the concepts of drawdown ration, defined as the ration of drawdown to the saturated thickness of the aquifer, and the coeff

nt of interference and introduced. A parametric dy shows the effect of different variables which lude number of wells, well spacing, barrier tance, and pumping time. The usefulness of se tests in the design and analysis of well fields emonstrated. (Bradbeer-NWWA)

SOME IN-SITU PERMEABILITY TESTS IN SANDS,
Halcrow (William) and Partners, London (England).
P. M. James.
Quarterly Journal of Engineering Geology, Vol 2, No 4, p 301-306, May, 1970. 2 fig, 1 tab, 4 ref.

Descriptors: *Permeability, *Water wells, *Water yield, *Aquifer testing, Subsurface flow, Test wells, Observation wells, Groundwater, Aquifer characteristics, Drawdown, Alluvial aquifers, Sand.
Identifiers: *In-situ permeability tests, *Maylaya.

The construction of a new head barrage for the Muda Irrigation Project, in northwest Maylaya, involved knowledge of the in-situ permeability of adjacent alluvial sands, in order to determine the extent of sheet pile cut-off needed on one side of the structure. The geological situation was determined from a number of earlier boreholes and a seismic traverse. Three wells were sunk to an impermeable layer and pump tests were made on each and the resulting drawdown measured in the remaining two. Permeability calculations were made using three different formulae. (Bradbeer-NWWA)

CAVITATION AND SIZE SCALE EFFECTS FOR ORIFICES,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. P. Tullis, and R. Govindarajan.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 99, No HY3, p 417-430, March, 1973. 9 fig, 1 tab, 10 ref.

Descriptors: *Cavitation, *Fluid mechanics, *Hydraulics, *Corrosion, *Orifices, Orifice flow, Nozzles, Pipes, Outlets, Hydraulic structures, Hydrology, Flow control, Flow rates, Flow system.
Identifiers: *Orifice size.

Data are presented for predicting various levels of cavitation for circular sharp-edged orifices of variable diameters and pressures. Values of the cavitation index at incipient (the onset of cavitation), critical, and choking cavitation are identified. Two subjective measures related to the interference with a normal conversational noise level, moderate and heavy cavitation regions are suggested. Pipe diameters ranged from 1.08 to 23.5 in., pressures from 20 to 200 psi and orifice/pipe size ratios from 0.332 to 0.884. Operation of an orifice at just below choking level is the time of maximum damage potential and unstable flow. The values of the cavitation index at choking vary with the orifice/pipe size ratio but are independent of size, pressure, and velocity. (Bradbeer-NWWA)

SCREEN THEORY FOR WELLS AND SOIL DRAINPIPES,
Iowa State Univ., Ames. Dept. of Agronomy.
M. S. Selim, and D. Kirkham.
Water Resources Research, Vol 10, No 5, p 1019-1030, October, 1974. 19 fig, 3 tab, 19 ref.

Descriptors: *Mathematical models, *Well screens, *Drainage systems, *Spatial distribution, Water wells, Flow, Flow system, Inflow, Flowrate, Fluid mechanics, Flow augmentation, Darcy's Law, Laplace's Equation.
Identifiers: *Screen theory, *Drain pipes.

A theoretical solution is given for steady flow in a confined aquifer to a well tube having equally spaced screens. It is shown, quantitatively, using Darcy's Law and Laplace's Equation, that more flow results if a given total length of screen is utilized in a number of sections over the full length of the well tube than if the given length of well screen is all used at the botton of the tube. For a pumped well of 0.25 foot radius, 200 foot radius of influence, 50 foot thickness of aquifer, and 25 foot length of screen, the use of the screen in five 5-foot sections equally divided over the well tube results in 25 percent more flow than if the sections are used in a single 25 foot length. Similarly ten 2.5 foot sections of screen will produce 33 percent more flow, and an infinite number of sections will increase the flow 45 percent. It is shown that the basic theory also applies to seepage flow to the joints between individual lengths of drainpipes used in land drainage. The results are presented in tables and graphs having dimensionless parameters so that flow for a particular system may be found in any unit. (Bradbeer-NWWA)

FACTORY AND FIELD TESTING OF PUMPS,
FMC Corp., Indianapolis, Ind. Pump Div.
R. A. Luley.
Journal of New England Water Works Association, Vol 86, No 4, p 330-346, December, 1972.

Descriptors: *Pump testing, *Performance, *Quality control, On-site Testing, Testing procedures, Venturi meters.
Identifiers: Field testing, Factory testing.

The Hydraulic Institute Test Code classifies pump tests as: (1) Factory tests at the pump manufacturers plant, and (2) Field tests at the place of installation. Pump performance is determined from four quantities: total energy added to the fluid by the pump, flow, power input to the pump shaft, and pump shaft speed. Total energy is calculated from the flow and pressure measurements, and the others are measured directly. The factory methods of testing are described. Since testing costs money, a problem arises in whether the acceptance test should be made at the factory or in the field. Most pumps provided with ideal flow conditions will perform better than with irregular flow. Field tests are useful to indicate wear and/or changing conditions from initial to future tests. The reliability of a field test is a function of the accuracy of the instruments used, their proper installation and proper use. Methods of field testing are described. Factory testing is the preferred method of accurate assessment of performance. (Bradbeer-NWWA)

PUMPING APPLICATIONS...SEWAGE, SLUDGE, AND SLURRY,
G. M. Leaney.
Pumps and Their Applications, No 105, p 770-773, June, 1975. 5 fig.

Descriptors: *Pumps, *Sewage treatment, *Centrifugal pumps, Impellers, Design criteria, Flow characteristics, Pumping, Maintenance costs, *Waste water treatment.
Identifiers: Positive displacement pumps, Rotodynamic pumps.

Types of pumps which may be used for controlling the flow of sewage are described and compared. Mechanical pumps are of two general categories--positive displacement and rotodynamic. Positive displacement action is one of compressing the medium; rotodynamic action is one of throwing. Two types of positive displacement pump designs are rotary and reciprocating. In rotary type pumps,

LIBRARY U. OF I. URBANA-CHAMPAIGN

all working parts rotate in one continuous direction so that discharge is uniform and regular. These are not suitable for handling large solids or abrasive materials. In reciprocating pumps, the general operating principle is that of a plunger driven back and forth, allowing the liquid into the cylinder, and emitting it at the opposite end of the stroke. Output from reciprocating pumps is pulsating and connecting pipelines are subject to pressure fluctuations. The other category of pumps, rotodynamic ones, have become widely used in sewage handling since the development of the open impeller type, a derivative of the centrifugal pump. Such pumps can cope with greater throughputs than can the positive displacement pumps. A uniform condition results from their use in that a definite head develops from the centrifugal pump, dependent upon the diameter of the impeller and the speed. Vertical type centrifugal pumps are positioned at the bottom of a pit; integral horizontal pumping units may be applied for pumping and tankage. While positive displacement pumps are more efficient than the rotodynamic pumps, the latter generally have lower maintenance costs and are less prone to wear in the handling of abrasive materials. MAKING THE MOST OF ROTARY PERCUSSION BITS,
Hughes Tool Co., Houston, Tex.
G. O. Atkinson, and M. Bender.
Water Well Journal, Vol 24, No 2, p 29-31, February, 1975. 7 fig.

Descriptors: *Rotary drilling, *Drilling equipment, *Efficiency, Drilling, Equipment, Wells, Rock mechanics, Drilling samples, Geologic investigations.
Identifiers: Rotary drilling percussion bits, Core, Handling, Reconditioning.

The greatest tool footage and fastest penetration rate can be achieved with rotary bits by observing three basin principles: (1) proper handling, (2) correct drilling practices, and (3) periodic reconditioning. The proper handling entails inspection for shipping damage, storage in a protective container and proper packing when transporting. Corrent drilling practives involve starting the air flow and rotation before applying preload to the bit and finding optimum running conditions of rotary speed and preload. A clean hole and careful sizing of a second bit in the same hole are usually helpful. Reconditioning involves sharpening the tungsten carbide buttons and restoring the gage relief taper. Most bits can be repeatedly reconditioned until the gage diameter has been reduced 1/2 inch. Further reconditioning will reduce the thickness of the outer heel row buttons below that required to resist breakage and will reduce the thickness of the metal at the circumference of the bit below that required to resist outer heal row button loss. (Cambell-NWWA)

THE ELECTRO-OSMOTIC GUILLOTINE, A NEW DEVICE FOR CORE CUTTING,
Bern Univ. (Switzerland). Geological Institut.
M. Sturm, and A. Matter.
Journal of Sedimentary Petrology, Vol 42, No 4, p 987-989, December, 1972. 3 fig, 4 ref.

Descriptors: *Marine geology, *Core sampling, Electro-osmosis, Unconsolidated sediments, Sediments.
Identifiers: *Core slicing, *Core cutting, *Electro-osmotic knife.

Cutting of unconsolidated pelitic sediments using the electro-osmotic effect was introduced in 1967. It is based on the electro-osmotic behavior of clays, that is if an electric field is applied to a clay mass the interstitial water is forced to flow from the positive to the negative electrode. Typically the core is cut starting from one end using a cheese cutter or knife connected to a DC source. Thereby, pebbles, pieces of wood or shells may be pushed along in front of the cutter causing distortion and grooves. The electro-osmotic guillotine splits the core simultaneously along its whole length. A core section up to one meter long is cut with this device. Drawings and specifications of the guillotine are included. The device minimizes the distortion of sedimentary structures and makes additional scraping unnecessary. (Campbell-NWWA)

COST COMPARISONS AND PRACTICAL APPLICATIONS OF AIR-LIFT PUMPING,
Universal Oil Products Co., Denver, Colo. Johnson Div.
D. L. Kill.
The Johnson Driller's Journal, p 1-3, September-October, 1974. 2 fig, 1 tab.

Descriptors: *Pumping, Water level, Power head, Measurement, *Cost comparisons.
Identifiers: *Air-lift pumps, Static water level, Pumping water-level.

Procedures for estimating the static water level in a well and the pumping water level are described for a well with a single-pipe airlift. Surging with compressed air without the use of an air line in the well as recently been successfully used during acid rehabilitation work. The procedure is outlined. In determining the needs of specific wells in relation to the magnitude of the required starting pressures and compressor volumes the starting pressure limits the depth of air line submergence. If the difference between total well depth and the static water level is less than 115 feet, a 50 psi compressor would have adequate starting pressure. Recommendations are made for varying well depths and static water levels. The volume of air needed is directly related to the volume of water desired to pump from the well. A table shows some average costs per cubic foot per minute of air for various size compressors. (Bradbeer-NWWA)

E EFFECT OF GEOLOGICAL FEATURES THE OCCURRENCE OF GAS OUTBURST ACTURES IN THE EAST MIDLAND COAL- LD,
lf Research and Development Co., Pittsburgh,

C. Arscott, and P. Hackett.
arterly Journal of Engineering Geology, Vol 2, 2, p 89-101, December, 1969. 7 fig, 2 plates, 1 , 18 ref.

Descriptors: *Gas, *Methane, *Explosions, *Coal mines, Geology, Structural geology, Fractures(Geologic), Joints, Stress.
Identifiers: *Gas outbursts, *East Midlands Coalfield(England), Preferred orientation.

The phenomenon of gas outbursts from the floor of excavations in the East Midlands Coalfield is examined and their general features such as growth, preferred orientation, regional trends, and location are described. An attempt is made to correlate the distinct grouping of the fractures in the Deep Hard Seam in North Derbyshire and the Low Main Seam in North Nottinghamshire and their uniform directional tendency with the known geological features of the area. The geologic structure and the orientation of joints are considered. A series of underground investigations allied to laboratory work and literature surveys indicate that the general structural geology of the area controls the occurrence of the fractures. THERMOVISCOELASTICITY OF AGING CONCRETE,
Northwestern Univ., Evanston, Ill.
Z. P. Bazant, and S. T. Wu.
Journal of the Engineering Mechanics Division, Proceedings of the American Society of Civil Engineers, Vol 11, No EM3, p 575-597, June, 1974. 16 fig, 1 tab, 65 ref.

Descriptors: *Concretes, *Construction materials, *Creep, Strain, Stress, Concrete testing, Aging, Curing, Statistical analysis, Engineering structures, Materials engineering, Concrete technology, Temperature, Energy.
Identifiers: *Thermoviscoelasticity, Temperature dependence.

Temperature directly influences the deformation rate of concrete and also affects the rate of aging. In previous studies the acceleration of aging due to temperature rise have been disregarded. This study attempts to evaluate the effect and is restricted to creep at constant, or nearly constant, water content. Using the developed procedure all of the more extensive published data on temperature dependence of creep were analyzed. The creep of aging concrete at variable temperature can be modeled by a rate-type creep law with hidden stresses as internal state variables. The model here is restricted to linear stress. It is advantageous to add the concept of activation energy because it specified the form of temperature dependence and allows a limited amount of data to be used. The activation energy does not appear to depend on the duration of loading. All of the examined data fits this model satisfactorily. Activation energy of creep varies for different concretes. (Campbell-NWWA)
W76-00277

CEMENT SPACER FLUID,
Halliburton Services, Duncan, Okla.
L. L. Carney.
Journal of Petroleum Technology, p 156-158, August, 1974. 1 fig, 2 tab.

Descriptors: *Cements, *Well linings, *Well contamination, Cement viscosity, Drilling fluid.
Identifiers: *Cement spacer.

Completion problems during the cementing of casings or liners in wellbores have confronted the oil and gas industry for many years. Generally, after the borehole has been drilled, the drilling mud employed is displaced by the cement used in cementing the casing or liner. Compositions and properties of drilling muds and cement slurries vary widely. Such variation may result in detrimental physical and chemical reactions at the interfacial contact. For example, when a high-viscosity, high-density fluid is used, the incompatibility may contribute to channeling in the annulus and may prevent a satisfactory cement-to-foundation bond. As a result, communication may occur between zones and possibly even to the surface. The persistence of these problems indicated a need for a single type of spacer fluid that could be employed effectively between the cement slurry and any type of mud. A field survey was conducted on several wells in South Texas and Mississippi to determine what cementing problems were being encountered with various drilling fluids and cements. The survey indicated that oil-based fluids and invert emulsions cause most of the problems. An emulsion spacer was developed in which salts were eliminated from the internal phase of the drilling fluid and the water phase was increased so the spacer could have equal parts water and hydrocarbon. The spacer has been used on many jobs in the field with excellent results. (Bradbeer-NWWA)

NEW BIT CONCEPTS GET TRYOUTS AT SANDIA LABORATORIES.
Engineering and Mining Journal, July, 1975, p 100-101, 3 fig.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Wells, Drilling Oil Industry, Rotary drilling, Drilling equipment.
Identifiers: Rock bits, Continuous chain bit, Penetration rates, Spark drilling, Terra drill.

Four new drill bits designed to increase cutting rates and reduce costs are under development at the Energy Research and Development Administration's Sandia Laboratories in Albuquerque, New Mexico. Two of the drills--one chips rock with high voltage spark discharges and the other fires small projectiles into the rock in advance of a regular roller bit--are designed to increase both penetration rates and downhole bit life. The other two systems aim primarily at increasing bit life. One permits a roller-cone bit to be folded and removed as another bit is cycled into place from a magazine containing 10 to 12 new bits. The other system places cutting surfaces on a chain that is advanced to bring new cutting surfaces into position. If the bits are successful, they will have special significance for deep well drilling, where pulling pipe to replace dulled bits is both costly and time-consuming. (Campbell-NWWA)

AIR ROTARY DRILLING WITH ORGANIC POLYMERS OFFERS MANY BENEFITS,
Universal Oil Products Co., Denver, Colo. Johnson Div.
B. J. Reichmuth.
Johnson Drillers Journal, Vol 46, No 6, p 1-3, November-December, 1974. 3 fig.

Descriptors: *Rotary drilling, *Water wells, Ground water, Drilling fluids.
Identifiers: Organic polymer drilling fluids, *Air rotary drilling.

The properties and advantages of organic polymers in drilling fluids are discussed. In the case history discussed, shale swelling and sloughing were encountered. Since it was necessary to keep the holes open for several hours, this posed several difficult problems. Air and foarm were used with only limited success. By injecting a Revert-foam solution with the air, shale swelling and clay sloughing were eliminated. Mixed with a small quantity of water and injected with air into the borehole, Revert coats the shale particles and prevents than from absorbing the water and swelling. Hole cleaning can also be accomplished at low annular velocities and lower air delivery rates. Other advantages include extra bit lubrication and reduced downhole friction. (Campbell-NWWA)

Quarterly Journal of Engineering Geology, Vc No 3, p 195-216, February, 1970, 4 fig, 5 tab ref.

Descriptors: *Flow characteristics, *Water we *Flow measurement, *Fissures, Geology, V data, Drilling, Instrumentation, Technology, F velocity, Flowmeter, Tracking techniq Tracers, Dye, Conductivity, Temperat *Hydrogeology.

ntifiers: *Percussion wells, *Closed-circuit evision, *Borehole logging.

e instrumentation and techniques developed for investigation of fissure-flow in consolidated ifers are described and illustrated by three case tories. Physical properties of the water mea- ed are the temperature, electrical conductivity, tical velocity by flowmeter and by tracer injec- n and horizontal velocity by television equip- nt. In order to identify strata, a remote focusing sed- circuit television camera was used. Its use outlined and the implications of flow rates by lyses of the tritium contents of some water mples are considered. The case histories were at the Speen Bridge Pumping Station, Newbury in 7, (2) the Edenhall Pumping Station, late 1967, (3) the Irton Pumping Station, early 1968. adbeer-NWWA)

LD RESULTS: NOISE-LOGGING CHNIQUE,
Cullough Services, Houston, Tex. Research Development.
S. Robinson.
roid News Bulletin, p 9-15, Spring, 1975. 7 fig.

scriptors: *Logging, *Methodology, *Borehole physics, *Leakage, Flow, Seepage, Subsur- e investigations, Oil, Gas, Oil-industry, wouts, Casing.
ntifiers: *Noise-logging, Casing failure, rehole leakage, Aquifer communication.

e noise-logging technique was introduced to the industry in 1972 and has been applied to the lo- ion of liquid or gas leaks in deep wells. The se-logging tool is a transducer that detects the chanical vibrations that produce sound and nsforms it into electric signals of alternating quency wave forms. The sensing equipment the principles of operation are described. A h noise level results from the pumping opera- n of a well and the movement of the detection ipment necessitating that the data be collected en the tool and line are stationary. Four types leaks and the associated noise-logs are ex- ned. Producing wells having channels or com- nication problems behind cemented casing, ce- nted wells that have developed channels before forating or after squeezing, wells with a history underground crossflow and blowout, and the ermination of relative flow rates from per- ated formations are discussed. Descriptors: *Water resources, *Minnesota, Education, Projects, Grants, Expenditures, Manpower, Management, Water pollution, Water Resources Research Act, Universities, *Water Resources Institute, *Research and Development, Government finance, Contracts.
Identifiers: Researchers, *Applied research, *Basic research, Physical-biological-economic-social Aspects, Faculty.

The fiscal year 1975 budget of the Center was $378,584. The Center supported 12 research projects involving 9 faculty members. These research projects were concerned with: developing a water resources research plan for Minnesota; developing indices for establishing water supply quality status and trends in Minnesota; analyses of organic carbon as a pollution index in Minnesota; spatial and temporal variation of precipitation in Minnesota; forecasting rainfall and snowmelt floods; determining the geochemical and biostratigraphic record of natural and pollution eutrophication of Minnesota Lakes bio-manipulation of Minnesota lakes for elimination of blue-green algae; determining the thermal pollution and second trophic level fauna in Lake Superior; social dimensions of water quality status and trends in Minnesota; assessment of water quality status and trends in Minnesota by remote sensing techniques; and hydronomic analysis of forest management alternatives for environmental quality. About 37 students received employment through the Center's program. During fiscal year 1975, there were 26 reports generated through research projects. (Waelti-Minnesota)

This volume is a revision of the Water Resources Thesaurus published in November 1966. It was prepared by the Smithsonian Science Information Exchange for the Water Resources Scientific Information Center, Office of Water Research and Technology. The scope of the Thesaurus encompasses the broad research areas of water resources such as the hydrologic cycle, supply and demand for water, conservation and the best use of available supplies of water, methods of increasing such supplies, and the economic, legal, social, engineering, recreational, biological, geographical, ecological, and quality aspects of water resources. These research areas are augmented by concepts important in water resources development. Over 7,000 separate changes were made to the hierarchical construction of the Thesaurus to allow for a logical embedded hierarchy of narrow terms for each descriptor. This embedded hierarchy of narrow terms was not present in the 1966 edition. The revised Thesaurus contains an alphabetical list of 4,288 approved main terms interfiled with 1,175 USE references that are intended to lead the user to the right descriptors. (OWRT)

The Effect of Pesticides on Byssus Formation in the Common Mussel, Mytilus Edulis,
W76-00328 5C

The Effect of Thermal Effluent Upon the Standing Crop of an Epiphytic Algal Community,
W76-00330 5C

A Simple Agar Plate Method, Using Micro-Algae for Herbicide Bio-Assay or Detection,
W76-00339 5A

BIOLOGICAL CIRCULATION (SALTS)

Biological Circulation of Salts in Salinized Soils of Georgian SSR, (In Russian),
W76-00081 2G

BIOLOGICAL COMMUNITIES

A New Measure of Biotic Similarity Between Samples and its Applications with a Cluster Analysis Program,
W76-00325 7B

BIOLOGICAL FILTERS

Filter for Purification of Waste Water.
W76-00348 5D

BIOLOGICAL TREATMENT

Determination of the Possibility of the Biological Treatment of Wastewaters Generated in Petroleum Refineries. Part V. Degradation of Naphthenic Acids and Sulfonic Acids (Determinarea Tratabilitatii biologice a apelor reziduale din rafinariile de petrol. V. Degradarea acizilor naftenici si a acizilor sulfonici).
W76-00126 5D

Biological Treatment of Wastewaters in a Cardboard Manufacturing Plant (Trattamento biologico delle acque di scarico di un cartonificio),
W76-00128 5D

Sewage Treatment to Meet Tomorrow's Needs,
W76-00264 5D

Current Trends in Packaged Wastewater Treatment Facilities, Part I,
W76-00272 5D

Biological Treatment of Effluent With Rotating Discs.
W76-00345 5D

Synthetic Surfactants in Urban Effluents and their Rate of Elimination in Biological Wastewater Treatment Plants (Sintetichskie poverkhnostnoaktivnye veshchestva v gorodskikh stokakh i effektivnost' ochistki ot nikh na biologicheskoy stantsii),
W76-00351 5D

One-Step Nitrification and Carbon Removal,
W76-00352 5D

Pure Oxygen Treatment of Wastewater,
W76-00354 5D

BIOTIC SIMILARITY

A New Measure of Biotic Similarity Between Samples and its Applications with a Cluster Analysis Program,
W76-00325 7B

BLASTHOLES

Fracturing in the Zone Around a Blasthole, WhitePine, Minnesota,
W76-00035 8B

BLEACHING WASTES

Influence of Effluents of Sulfite Cellulose Factory on Algae in Cultures and Receiving Waters,
W76-00045 5C

The Recycling of Kraft Bleach Wastes,
W76-00051 5D

BLOWOUTS

'Migration' of Blowouts in Seagrass Beds at Barbados and Carriacou, West Indies, and Its Ecological and Geological Implications,
W76-00329 5C

BLUE CRAB

Effects of Ingested Mirex and DDT on Juvenil Callinectes Sapidus Rathbun,
W76-00333 5C

BLUEGILL

Accumulation and Eliminating Studies of Fou Detergent Fluorescent Whitening Agents i Bluegill (Lepomis Macrochitus),
W76-00318 5A

BONE CREEK (SC)

Boone Creek Oil Spill,
W76-00147 5C

BOREHOLE GEOPHYSICS

Field Results: Noise-Logging Technique,
W76-00423 8G

BOREHOLE LOGGING

The Hydrogeological Investigation of Fissure Flow by Borehole Logging Techniques,
W76-00417 8G

BOREHOLES

Geological Society Engineering Group Workir Party Report on The Logging of Rock Core for Engineering Purposes.
W76-00412 8

The Use of Resistivity Logging to Estima Borehole Yield from a Matrix-Conductir Sandstone,
W76-00419 4

BOTTOM SEDIMENTS

Geochemical and Sedimentological Analysis Tygart Lake, West Virginia,
W76-00376 5

Trace Element Composition of Stream Sec ments, An Integrating Factor for Water Qua ty,
W76-00377 5

Evaluation of a Recreational Lake Rehabilit tion Project,
W76-00379 5

BOUNDARY LAYERS

Hydraulic Jump in a Rough Channel,
W76-00311 8

BOWEN RATIO

Comparison of Evaporation Measuremen Using Different Methods,
W76-00020 2

BROMINE

Kinetics of Viral Inactivation by Bromine,
W76-00118 5

BROWN TROUT

Oxygen consumption in the Brown Trou Salmo Trutta M. Fario L,
W76-00283

BUFFALO RIVER (ARK)

Trace Element Composition of Stream Se ments, An Integrating Factor for Water Qua ty,
W76-00377

BUNKER C FUEL

A Study of the Effects of the San Francisco Spill on Marine Life, Part II: Recruitment,
W76-00135

BUNTER SANDSTONE

Some Hydrogeophysical Properties of Bunter Sandstone of Northwest England,
W76-00413

YSSYS ATTACHMENT
The Effect of Pesticides on Byssus Formation in the Common Mussel, Mytilus Edulis,
W76-00328 5C

ADMIUM
Removal of Cadmium from Waters and Wastes by Sorption on Hydrous Metal Oxides for Water Treatment,
W76-00107 5D

The Depositional Environment of Zinc, Lead and Cadmium in Reservoir Sediments,
W76-00292 5B

ALICHE
The First Hydrological Application of a Space Photograph, Tamil Nadu, India, 1967,
W76-00486 7B

ALIFORNIA
Discussion (Of, 'Interdisciplinary Approach to Geothermal Development,' by M. K. Fulcher),

W76-00225 5D

VIRGINIA INST. OF MARINE SCIENCE, GLOUCESTER POINT.
Petroleum Hydrocarbons and Oyster Resources of Galveston Bay, Texas,
W76-00143 5C

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG.
High-Rate Water Treatment: The State-of-the-Art,
W76-00226 5F

VIRGINIA POLYTECHNIC INSTITUTE AND STATE UNIVERSITY, BLACKSBURG. DEPT. OF AGRICULTURAL ENGINEERING.
Finite Element Simulation of Flood Hydrographs,
W76-00303 2E

VOLGOGRAD AGRICULTURAL INST. (USSR).
Forecasting the Occurrence of Wind Erosion of Soil, (In Russian),
W76-00362 2J

WALK, HAYDEL AND ASSOCIATES, INC., NEW ORLEANS, LA.
Upflow Filter for Potable Water Production,
W76-00222 5F

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF AGRONOMY AND SOILS.
Evaluation of a Thermocouple Hygrometer for Measuring Leaf Water Potential in Situ,
W76-00153 2I

WASHINGTON UNIV., ST. LOUIS, MO. CENTER FOR THE BIOLOGY OF NATURAL SYSTEMS.
Fertilizer Application Rates and Nitrate Concentrations in Illinois Surface Waters,
W76-00290 5B

WATER MANAGEMENT BOARD, BRNO (CZECHOSLOVAKIA).
Nitrate Determination With Indigo Carmine,
W76-00021 5A

WATER POLLUTION RESEARCH LAB., STEVENAGE (ENGLAND).
Observations on the Performance of Polishing Lagoons at a Large Regional Works,
W76-00268 5D

Instrumentation for Monitoring Water Quality,
W76-00360 5A

WATER RESOURCES BOARD, READING (ENGLAND).
Saline Ground Waters in the Carboniferous Rocks of the English East Midlands in Relation to the Geology,
W76-00488 2F

WATERLOO UNIV. (ONTARIO). DEPT. OF BIOLOGY.
The Catastrophic Drift of Stream Insects After Treatments with Methoxychlor (1,1,1-Trichloro-2,2-Bis(p-Methoxyphenyl) ethane),
W76-00327 5B

WATTS, BLAKE, BEARNE AND CO. LT., DEVONSHIRE (ENGLAND).
Drilling Techniques in Ball Clays,
W76-00415 8C

WEST VIRGINIA UNIV., MORGANTOWN, DEPT. OF GEOLOGY.
Geochemical and Sedimentological Analysis of Tygart Lake, West Virginia,
W76-00376 5B

WESTERN CO. OF NORTH AMERICA, DALLAS, TEX.
Expansive and Shrinkage Characteristics of Cements Under Actual Well Conditions,
W76-00390 8F

WESTERN INTERSTATE COMMISSION FOR HIGHER EDUCATION, BOULDER, COLO.
Environmental Impacts of Saline Seep in Montana,
W76-00193 2F

WESTERN MICHIGAN UNIV., KALAMAZOO.
River Quality and Industrial Adjustment: A Case Study,
W76-00039 5G

WESTERN WASHINGTON STATE COLL., BELLINGHAM. DEPT. OF GEOGRAPHY.
Bayocean Spit, Oregon: History of Development and Erosional Destruction,
W76-00004 2L

WESTGATE RESEARCH CORP., MARINA DEL REY, CALIF.
UV-Ozone Oxidation/Sterilization Process,
W76-00243 5D

WHITMAN AND HOWARD, INC., BOSTON, MASS.
Economizing in Design Without Sacrificing Quality,
W76-00208 5F

WILEY AND WILSON, INC., LYNCHBURG.
Design for Joint Treatment of Municipal and Paper Mill Waste at Lynchburg, Virginia,
W76-00042 5D

WISCONSIN UNIV., MADISON.
Panel on Discipline Viewpoints and Positions Ecology,
W76-00064 6C

Effect of Nutrient Input Reduction on the Eutrophication of the Madison Lakes.
W76-00500 5C

WISCONSIN UNIV., MADISON. INST. FOR ENVIRONMENTAL STUDIES.
Panel on Discipline Viewpoints and Positions Socio-Economics,
W76-00062 6I

WND-WORTHINGTON-SIMPSON LTD., NEWARD (ENGLAND).
Which Pump.
W76-00416 8C

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS. DEPT. OF CHEMISTRY.
Evaluation of Some Methods of Analysis fo Petroleum Hydrocarbons in Marine Organisms
W76-00320 5A

WORTHINGTON CORP., HARRISON, N.J.
Worthington Corporation Conceptual Design o a 50 MGD Desalination Plant.
W76-00170 3A

WYOMING UNIV., LARAMIE. COLL. OF LAW
Panel on Discipline Viewpoints and Positions Political Science and Law,
W76-00063 6I

WYOMING UNIV., LARAMIE. DEPT. OF CIVIL ENGINEERING.
Model Sand Filters for the Removal of Col loidal Manganese Oxides Using Selected Ca tions as Filter Aids,
W76-00111 5I

YAMAZAKI CHEMICAL LAB., YOSHII (JAPAN).
Investigations on the Conditions for Wet Ai Oxidation of Collagen and Tallow as Mai Components of Tannery Waste, (In Japanese),
W76-00121 5I

On the Wet Air Oxidation Products of Collage and Tallow, (In Japanese),
W76-00131 5D

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

LIBRARY U. OF I. URBANA-CHAMPAIGN

VOLUME 9, NUMBER 2
JANUARY 15, 1976

W76-00501 -- W76-01000

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

LIBRARY U. OF I. URBANA-CHAMPAIGN

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

HYDROGRAPH RESPONSES TO WATERSHED MODEL SIZE AND SIMILITUDE RELATIONS,
State Univ. of New York at Syracuse. Coll. of Environmental Science and Forestry.
P. E. Black, and J. W. Cronn, Jr.
Journal of Hydrology, Vol 26, No 3/4, p 255-266, August 1975. 4 fig, 4 tab, 28 ref.

Descriptors: *Hydrographs, *Model studies, *Laboratory tests, *Drainage area, *Rainfall simulators, Time of concentration, Peak discharge, Unit hydrographs, Recession curves, Rainfall intensity, Watersheds(Basins).
Identifiers: *Geomorphic parameter, Hydrologic similitude.

A study was conducted on laboratory models under a rainfall simulator to isolate the geomorphic parameter of size of the drainage basin and to determine the relationship between relative size and selected hydrograph characteristics. Three different basin sizes and two drainage patterns were modeled but the soil depth, stream and slope gradients, and drainage densities were kept unchanged. The soil was simulated by 3/8 inch thick layer of polyurethane foam featuring a variety of pore sizes. The main conclusions were: the maximum peak increases with drainage area, time of concentration increases nonlinearly with drainage area, and the time base of the hydrograph and the decay time increase with the drainage area. A comparison of model data and the real-world watersheds indicated that the extent of relationship between the models and the real-world watersheds can be expressed in terms of a factor of similitude, which is highly correlated with the drainage area. RAINFALL-RUNOFF RELATIONS ON URBAN AND RURAL AREAS,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
E. F. Brater, and J. D. Sherrill.
Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-670/2-75-046, May 1975. 97 p, 36 fig, 11 tab, 39 ref. 1BB034; ROAP 21ATB; Task 008. 11040 DRS.

Descriptors: Watersheds(Basins), Michigan, *Mathematical models, Unit hydrographs, *Runoff, *Rainfall-runoff relationships, *Cities, *Infiltration, Surface runoff, *Storm runoff, *Rural areas, *Hydrograph analysis, Urbanization.
Identifiers: Infiltration/retention, Infiltration capacity.

A procedure was developed for estimating the frequency of storm runoff of various magnitudes from rainfall and/or snowmelt on small drainage basins in various stages of urbanization. The study was based primarily on the analysis of storm runoff events on real basins varying in size from 0.02 to 734 sq mi. The method is based on applying unit hydrographs to precipitations of various frequencies after deducting infiltration and retention. A concurrent study with an analytical drainage basin model provided additional understanding of the effects of some parameters. The unit hydrograph-infiltration capacity concept was selected as the most accurate practical method for predicting storm runoff. It was found that the form of the unit hydrograph could be related to drainage basin size and degree of urbanization as measured by population density. Other characteristics of the drainage basin are much less important. The form of the unit hydrograph stays relatively constant for various durations and magnitudes of input as long as the duration of input is smaller than a critical time which can also be related to the size and population density of the basin. As the population increased from rural to highly urbanized, peak discharges for the same runoff became as much as ten times greater. Infiltration capacity was found to vary seasonally. The predicition of flood frequency by this procedure is fully operable for Southeastern Michigan. For application to other areas some hydrograph analysis must be made. (EPA)

THE SHORTEST TIME SEQUENCE OF HEAVY RAINFALL AND ITS EFFECT ON STORM-WATER RETENTION TANKS (DIE KUERZESTE ZEITFOLGE VON STARKREGEN UND THRE AUSWIRKUNG AUF REGENBECKEN),
R. Pecher.
Wasser und Boden, Vol 24, No 10, p 303-304, 1972. 1 fig, 9 ref.

Descriptors: *Precipitation intensity, Data collections, Design criteria, Depth-area-duration analysis, Storage capacity, Storage requirements, Storm water, Discharge(Water).
Identifiers: West Germany.

Precipitation recordings at Munich-Bavariaring over 15 consecutive summer periods were conducted in an attempt to determine the shortest time sequence of heavy rainfall and the frequency of such periods, important factors when dimensioning storm water retention basins. While this 15-year period was too short to allow conclusions on the frequency of such heavy rainfall sequences, it was found that the intervals between rainfall of relatively low intensity are usually shorter than those between high-intensity rains. It is concluded that to avoid overloading storm water retention basins, design criteria for such basins should allow for discharge of storm water loads in less than 8 to 10 hours. (Sandoski-FIRL)

THE UNCERTAINTIES IN SEARCH OF DESIGN PRECIPITATIONS AS INPUT DATA FOR RAINFALL-RUNOFF-MODELS (DIE PROBLEMATIK BEI DER ERMITTLUNG VON MASSGEBLICHEN NIEDERSCHLAEGEN ALS EINGANGSDATEN FUER NIEDERSCHLAG-AB-FLUSS-MODELE),
U. Maniak.
Wasser und Boden, Vol 24, No 10, p 299-303, 1972. 8 fig, 19 ref.

Descriptors: *Rainfall-runoff relationships, Data collections, Distribution patterns, *Precipitation intensity, Probable maximum precipitation, *Risks.
Identifiers: West Germany.

Data on extended heavy rainfall events of small probability, to be used as input data for rainfall-runoff models, were derived from long-term rainfall recordings in northwestern Germany. The approximate values for events of maximum precipitation in that territory were in good accordance with extrema obtained for neighboring countries. Such events have low frequency. Parametric charts for the determination of the daily rainfall for a

LIBRARY U. OF I. URBANA-CHAMPAIGN

specified period of time in any locality of the above territory are available with seasonal variations taken into consideration. A statistical approach to the evaluation of the territorial distribution can determine the maximum extension of heavy rainfalls. (Sandoski-FIRL)

ROLE OF SYNTHETIC TIME SERIES IN HYDROMETEOROLOGICAL DATA ANALYSIS,
Central and Southern Florida Flood Control District, West Palm Beach.
A. N. Shahane, D. Thomas, and P. Bock.
Water Resources Bulletin, Vol. 11, No. 4, p 770-782, August 1975. 2 fig, 5 tab, 12 ref.

Descriptors: *Time series analysis, *Synthetic hydrology, *Meteorology, *Statistical methods, *Evapotranspiration, Methodology, Hydrologic data, Stochastic processes, Analytical techniques, Hydrologic systems.
Identifiers: *Spectral analysis, *Sensitivity analysis, Stationarity, Harmonics.

The use of synthetic time series to increase confidence in the statistical parameters of limited hydrometeorological time series was investigated. A sensitivity analysis was performed to assess the effect of nonstationarity, number of lags, and small sample size on estimated spectral densities. The effects of harmonic-removal procedure on the residual series and the confidence limits in cross-spectral analysis were examined. Use of spectral analysis was found inadequate for investigating the effects of trend removal procedure on residual series. The synthetic time series analysis showed that such series were useful for selecting the proper number of lags, smoothing technique, and confidence limits. Sensitivity analysis performed on statistical variables of hydrometeorological and synthetic time series revealed the importance of proper number of lags and weights in cross-spectral analysis. Synthetic time series could be effectively used in detecting erratic behavior of the statistical parameters and in increasing confidence in the final estimates of statistical parameters. (Singh-ISWS)

CLIMATE OF MINNESOTA, PART VIII--PRECIPITATION PATTERNS IN THE MINNEAPOLIS-ST. PAUL METROPOLITAN AREA AND SURROUNDING COUNTIES,
Minnesota Dept. of Natural Resources, St. Paul. Div. of Water, Soils and Minerals.
E. L. Kuehnast, D. G. Baker, and J. W. Enz.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-246 189, $3.75 in paper copy, $2.25 in microfiche. Tech. Bull 301, Agricultural Experiment Station, Univ. of Minn. 1975. 36 p, 25 fig, 10 tab, 11 ref. OWRT B 068-MINN (3).

Descriptors: *Minnesota, *Climates, *Precipitation(Atmospheric), *Rainfall, *Weather data, Cities, Water supply, Precipitation intensity
Identifiers: *Urban climatology, Precipitation variation, *Minneapolis-St. Paul area.

This study concentrated on the monthly, seasonal, and annual precipitation that falls within the 7,200 square mile area centered around the Twin Cities of Minneapolis and St. Paul. Records from 75 stations were available for the 14-year period 1959-1972. It was determined that the May-September station density of one per 96 square miles is sufficient to detect more than 99 percent of the summer storms of 0.01 inch or more. The total annual precipitation averaged 29.17 inches, varying from 26.96 inches at Forest Lake to 32.39 inches at Ellsworth, Wisconsin. The major forecasting and observing station within the area, MSPAP (Minneapolis-St. Paul International Airport station), averaged only 27.08 inches, or 2.09 inches below the areal mean. Areas of persistently low precipitation centered around MSPAP, with two centers of high percipitation located to the north-northwest and northeast of MSPAP in Hennepin and Washington Counties, respectively. The higher precipitation amounts in these two areas were limited to the May-September period. The differences in precipitation amounts between stations in high and low regions were found to be statistically valid. High precipitation areas are explained by the occurrence of low level moisture convergence zones that result from a combination of local topography, summertime convective activity, and the surface winds at the time of precipitation. Tornado paths within the area were shown to apparently prefer paths or alleys that more or less coincide with the orientation and location of the high precipitation areas. (See also W75-10009)

RAINFALL MEASUREMENTS ABOVE AND IN THE CANOPY OF A MIXED OAK FOREST,
Brussels Univ. (Belgium). Laboratoire de Botanique Systematique et d'Ecologie.
G. Schnock.
Oecol Plant. Vol 8, No 1, p 17-23. 1973. (English summary).

Descriptors: *Rainfall, Precipitation(Atmospheric), *Measurement, Forests, Oak trees, Rain gages, Canopy, *Throughfall.
Identifiers: Hornbeam, Oak, Belgium.

Measurement of total rainfall above the canopy shows that in all the cases known at present, the sizes of water collected at this level are always lower than those measured in the open on a near plot (meadow). Differences are essentially dependent of the wind speed, the model of rain gauge and the canopy roughness. With 3 shelterless rain gauges fixed at 5 m above the canopy, at the level of crowns and in a small opening into the limbs, 93.9, 94.7 and 97.6%, respectively, of total rainfall collected in open during a 10 mo. period was obtained. In an oak-hornbeam forest the deficit observed for a 14 mo. period reaches 21%. Throughfall and interception loss calculations for the mixed oakforest of Virelles (Belgium) with these different values lead to an overestimation of throughfall (8.4-11.7%) and an underestimation of interception (9.1-12.7%).--Copyright (c) 1974, Biological Abstracts, Inc.

RETARDATION OF CONDENSATION NUCLEI GROWTH BY SURFACTANT,
Missouri Univ., Rolla. Graduate Center for Cloud Physics Research.
J. Podzimek, and A. N. Saad.
Journal of Geophysical Research, Vol 80, No 24, p 3386-3392, August 20, 1975. 7 fig, 1 tab, 53 ref, 1 append. ONR N00014-69-A-0141-0005; NSF GA-36041.

Descriptors: *Condensation, *Drops(Fluids), *Surfactants, Model studies, Mathematical models, Monomolecular films, Chemicals, Alcohols, Retardants, Fog, Clouds, Particle size, Laboratory tests, Cloud physics, Meteorology.
Identifiers: *Drop growth, Cetyl alcohol, Cloud models.

A one-dimensiona cloud model was used to show how the coverage of droplets by surfactant films can suddenly change the growth of certain sizes of drops in a cloud drop spectrum. The retarded or accelerated growth depends upon the nature and thickness of the surfactant film, the size of the nuclei, and the cooling rate of the air parcel. The model also indicated some possibilities of how to influence the development of cloud drop spectra that grow on a specific type of nuclei. Small nuclei, which might greatly outnumber the large ones, can be quickly activated, and thereby a cloud or fog will become colloidally unstable. However, the final effect depends strongly upon the assumptions made for the distribution of a surfactant among different sizes of nuclei. (Sims-ISWS)

ms, *Supplemental waters, Injunctive relief, bying.

re is a developing body of statutory adminis- ive, and case law concerning weather modifi- on activities. Cloud seeding is used to aid cultural recreational businesses by making rain preventing hailstorms. This technique is con- versial, however, because of the adverse side- cts such as flooding which may occur. In the ence of statute, courts have refused to charac- ze cloud seeding as an extra-hazardous activi- and persons seeking damages must prove ac- damage and tortious conduct. There is a trend ards administrative rather than judicial resolu- of conflicts. At least 31 states have statutes ch deal with weather modification in some n. The general pattern is to authorize an agency regulate cloud seeding. The prevalent niques are registration of proposed projects, rational and professional licensing, govern- tal contracts for cloud seeding and public in- vement. Several states authorize agencies to oin illegal weather modification activities. In area of atmospheric water rights, the common riparian rights doctrine would deny a cloud der access to water caused by the seeding un- he owned land bordering on a supplemental er source. Only Colorado and Utah have cted laws recognizing that a landowner may ap- priate atmospheric water. The most recent slation emphasizes the environmetnal impact weather control. The federal government has n most active in this area, particularly in fund- pilot projects to test the long range effects of id seeding. Cloud seeding is currently hibited in federal wilderness areas. This limited eral involvement in regulation of weather con- will expand as seeding proposals take on intra- e and international importance. (Jenkins- rida)

MPRESSIBILITY CHARACTERISTICS OF DISTURBED SNOW,
ld Regions Research and Engineering Lab. nover, N.H.
Abele, and A. J. Gow.
search Report 336, May 1975. 57 p, 14 fig, 1 tab, f, append.

scriptors: *Snow, *Compressibility, mpressive strength, *Mechanical properties, ysical properties, Trafficability, Ice, Crystal- tion, Crystals, Crystallography, Glaciers, ess, Density, Deformation, Compaction, ength of materials, Temperature, Laboratory ts, Cold regions.

e effects of snow temperature, rate of deforma- n, and initial density on the stress vs. density l stress vs. deformation relationships were in- tigated in the pressure range of 0.1 to 75 bars. e rate of deformation in the range of 0.027 to 27 /sec did not have a significant effect. A rease in temperature in the range of 0 to -40 grees C increased the resistance to stress and ormation, the temperature effect increasing h applied pressure and initial density. The ef- t of initial density was significant. For any ess, an increase in the initial density resulted in increase in the resulting density, particularly at stress levels and at temperatures near 0 grees C. The texture of artificially compacted ow was significantly different from that of natu- y compacted snow of the same density because of the very short recrystallization time period. (Sims-ISWS)

FLOATING ICE THICKNESS AND STRUCTURE DETERMINATION--HEATED WIRE TECHNIQUE,
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
R. O. Ramseier, and R. J. Weaver.
Environment Canada, Technical Bulletin 88, 1975. 16 p, 10 fig, 8 ref, 2 append.

Descriptors: *Ice, *Measurement, *Instrumentation, Lake ice, Sampling, Equipment, Gages, On-site data collections, Data collections.
Identifiers: *Floating ice, *Ice thickness, River ice, Ice measurement, Heated wire technique.

The thickness of floating ice is one of the most important general parameters to be measured for many applications in the fields of transportation, engineering and climatology. The requirement for accurate thickness information, with details on the ice structure, led to the development and use of the heated wire ice thickness gage. Once installed, the gage provides a means of making in-situ thickness measurements on fresh and salt water ice quickly and accurately. The measurement methods of determining ice structure from readings obtained were described, along with details of construction of the gage complete with engineering drawings. (Sims-ISWS)

ON THE ORIGIN OF PINGOS,
Vrije Universiteit, Amsterdam (Netherlands). Earth Sciences Inst.
H. Ryckborst.
Journal of Hydrology, Vol. 26, No. 3/4, p 303-314, August 1975. 4 fig, 16 ref.

Descriptors: *Permafrost, *Frozen soils, *Arctic, *Canada, Cold regions, Frost heaving, Soil mechanics, Hydrology, Ice, Tundra, Surface tension, Capillary action, Heat flow.
Identifiers: *Pingos, *Ice lenses, *Tuktoyaktuk peninsula(Canada).

Pingos on the Tuktoyaktuk peninsula, Northwest Territories, Canada, originate as upward-growing ice lenses above the water table in the active layer in sand whose pF value exceeds unity and is therefore unsaturated. The lenses grow at the base at a rate of 50-300 mm/yr, thus lifting the entire lens and overburden. They melt partially at the top (10-30 mm/yr) during the short arctic summer (100 days). Thin ice lenses, up to about 0.12 m, develop quite rapidly in sandy soils in a period of one winter. The intermediate lenses up to 14 m may grow in silty soils in a period of 75 years, whereas the slowly growing thick ice lenses such as pingos of 60 m require almost a millenium to develop. Pingos grow in areas of abundant water supply, e.g., ground-water-discharge areas. Under severe periglacial conditions the long-term average annual air temperature of -10C ensures a restricted summer melt of 10-30 mm/yr. This gives the pingo ice lens, which grows at the base at a rate of 50 mm/yr, a chance to develop slowly. The controlling factors for the growth of a pingo are the overburden pressure and the presence of a thin silt or clay lens embedded in the partly saturated sand at the pingo base. The silt or clay lens prevents the downward penetration of the growing ice lens and yet allows an upward water flow of 0.25 mm/day to exist. It is not likely that pingos will grow beyond a height 0f 60-70 m. (Sims-ISWS)
W76-00899

A DRAG PARTITION THEORY FOR DETERMINING THE LARGE-SCALE ROUGHNESS PARAMETER AND WIND STRESS ON THE ARCTIC PACK ICE,
Washington Univ., Seattle. Dept. of Atmospheric Sciences.
S. P. S. Arya.
Journal of Geophysical Research, Vol. 80, No. 24, p 3447-3454, August 20, 1975. 6 fig, 1 tab, 22 ref. NSF DES74-00964 A01.

Descriptors: *Ice, *Ice cover, *Arctic, *Model studies, Mathematical models, Sea ice, Drag, Stress, Boundary layers, Wind pressure, Cold regions, Arctic Ocean, Theoretical analysis.
Identifiers: *Roughness parameter(Ice), Drag partition.

A simple drag partition theory was developed for the classical problem of boundary layer flows over regular arrays of two- or three-dimensional roughness elements. The theoretical expression for the ratio of the form drag on these elements to the total drag was shown to be in good agreement with wind tunnel observations. It was used for determining the contribution of form drag on pressure ridges to the total wind stress on the arctic pack ice. The theory also lead to an expression for the large-scale roughness parameter as a function of mean ridge height, ridging intensity, small-scale or local roughness parameter, and an average form drag coefficient. It was required for determining the average wind stress over large areas of the Arctic on a routine basis, using the so-called geostrophic drag method, as invisaged in the Aidjex program. 2D. Evaporation and Transpiration

A THEORY FOR LOCAL EVAPORATION (OR HEAT TRANSFER) FROM ROUGH AND SMOOTH SURFACES AT GROUND LEVEL,
Cornell Univ., Ithaca, N.Y. School of Civil and Environmental Engineering.
W. Brutsaert.
Water Resources Research, Vol 11, No 4, p 543-550, August 1975. 7 fig, 40 ref.

Descriptors: *Evaporation, *Heat transfer, Atmosphere, Humidity, Shear, Turbulent flow, Eddies, *Model studies, Surface tension, Theoretical analysis, Interfaces, *Diffusion, Diffusivity, Drag, Shear stress.
Identifiers: *Similarity models, Turbulent transfer, Surface sublayer, Dimensionless parameters, Dalton number, Prandtl number, Surface roughness, Interfacial sublayer, Dynamic sublayer.

A model proposed in 1965 for evaporation as a molecular diffusion process into a turbulent atmosphere was extended by joining it with the similarity models for turbulent transfer in the surface sublayer. The assumed mechanisms were suggested by available flow visualization studies near smooth and rough walls; the theoretical result was in good agreement with available experimental evidence. The important dimensionless parameters governing the phenomenon near the surface were the Dalton (or Stanton) number (i.e., mass transfer coefficient), the drag coefficient, the roughness Reynolds number (except for smooth surfaces), and the Schmidt (or Prandtl) number. The proposed formualtion allowed the evaluation of the effects of some parameters, such as surface roughness or molecular diffusivity, that were not well understood before this. An importnat practical result was that, in contrast to the drag coefficient, the Dalton number is relatively insensitive to changes in roughness length. (Roberts-ISWS)

EVAPOTRANSPIRATION BY PHREATOPHYTES IN THE NORTH PLATTE BASIN OF WYOMING,
Wyoming Univ., Laramie. Water Resources Research Inst.
R. W. VanKlaveren, L. O. Pochop, and W. E. Hedstrom.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-246 194, $3.75 in paper copy, $2.25. Water Resources Series No 56, June 1975. 27 p, 5 fig, 8 tab, 17 ref. Partial completion report. OWRT A-014-WYO(2). 14-31-0001-5051.

Descriptors: *Phreatophytes, *Evapotranspiration, *Wyoming, Cottonwoods, Willow trees, Rivers, River basins, Vegetation, Tributaries.
Identifiers: *North Platte River Basin(Wyo), Laramie River(Wyo), Medicine Bow(Wyo), Sweetwater River(Wyo).

A survey of phreatophyte vegetation and its water usage was conducted for the North Platte Basin of Wyoming. The study was limited to the phreatophyte vegetation along the North Platte River and its three main tributaries: the Laramie, Medicine Bow, and Sweetwater Rivers. An estimated 90 to 95% of the phreatophytes were either cottonwoods or willows. Long-term annual average evapotranspiration rates of .94, .81, and .67 m for high, medium, and low density vegetation, respectively, were estimated using the Blaney-Criddle method. The total estimated long-term annual evapotranspiration was 8,121 hectare-meters for the four major rivers in the North Platte Basin of Wyoming.

ESTIMATING EVAPORATION: A TECHNIQUE ADAPTABLE TO REMOTE SENSING,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
S. B. Idso, R. D. Jackson, and R. J. Reginato.
Science, Vol 189, No 4207, p 991-992, September, 1975. 3 fig, 7 ref.

Descriptors: *Evaporation, *Climatic data, *Estimating, *Soil surfaces, *Water loss, *Remote sensing, Model studies, Physical properties, Climatology, Solar radiation, Temperature, Water balance, Arid lands, Air temperature, Synthetic hydrology, Mathematical models, Thermal properties, Albedo, Air-earth interfaces, Soil temperature, Soil moisture, *Arizona.
Identifiers: Avondale loam, *Phoenix(Ariz).

A procedure given for calculating 24 hour totals of evaporation from wet and drying soils uses the following information: the daily solar radiation, maximum and minimum air temperatures, moist surface albedo (readily estimated or obtainable from a one-time measurement), and maximum and minimum surface temperatures (obtainable from surface or airborne sensors). Tests of the method on a bare field of Avondale loam at Phoenix, Arizona, have shown success regardless of season. (Robinett-Arizona)

EVAPOTRANSPIRATION,
Forest Service (USDA), Durham, N.H. Northeastern Forest Experiment Station.
C. A. Federer
Reviews of Geophysics and Space Physics, Vol 13, No 3, p 442-445, 487-494, July, 1975. 238 ref.

Descriptors: *Evapotranspiration, Climatology, Environmental effects, Evaporation, Lysimeters, Soil moisture, Stomata, Transpiration, Water loss, Water vapor, Plant physiology, Turgidity, Water balance, Tracers, *Bibliographies.
Identifiers: Penman's equation, Monteith's equation.

The principal goal of evapotranspiration (ET) research is to find methods for calculating the value of ET under any given conditions. This study centers on ET as a physiologically controlled process, emphasizing stomatal behavior. Penman's equation is discussed along with water potential, water availability, and ET model systems. ET measurement by tracer techniques, lysimeters, and the Bowen ratio, is briefly discussed, and an analysis with Monteith's equation is included. Methods are needed for estimating watershed ET that are based on an understanding of the physics and physiology of evapotranspiration, not on soil moisture conditions. (Robinett-Arizona)

INFLUENCE OF SOIL-WATER POTENTIAL ON THE WATER RELATIONSHIPS OF HONEY MESQUITE,
Texas State Technical Institute, Amarillo.
S. J. Easter, and R. E. Sosebee.
Journal of Range Management, Vol 28, No 3, p 230-232, May, 1975. 3 fig, 32 ref.

Descriptors: *Soil moisture, *Plant physiology, *Semiarid climates, *Water loss, *Water requirements, Moisture tension, *Texas, Moisture availability, Moisture content, Moisture deficit, Soil-water-plant relationships, Desert plants, Range management, Plant growth, Mesquite, Hygrometry, Irrigation effects, Moisture stress, Transpiration, Plant growth.
Identifiers: Lubbock(Tex), Soil water potential, *Honey Mesquite(Prosopis glandulosa Torr. var. glandulosa).

Thermocouple psychrometry was used to measure soil and plant water potentials of honey mesquite growing under irrigated and nonirrigated field conditions. Irrigated trees showed more internal stress (Average minimum water potential=-30.9 bars) than nonirrigated trees (average minimum water potential=-19.4 bars). Water potential and transpiration rates adhered to a very distinct daily pattern with minimum water potential occuring at about noon in the trees growing on both sites. During the growing season, the average transpiration rate for irrigated trees was 0.0000959 grams/sq cm-minute, and .0000715 grams/sq cm-minute for nonirrigated trees. Irrigated trees produced 2 times the foliage of nonirrigated trees and had the greatest amount of soil water depletion. Results indicate that water loss in honey mesquite growing in upland sites or in shallow soils (relatively dry areas) is less than the amount lost from trees growing on bottomland and riparian sites. (Robinett-Arizona)

THE INFLUENCE OF LOCAL ADVECTION ON EVAPO-TRANSPIRATION FROM IRRIGATED RICE IN A SEMI-ARID REGION,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Div. of Irrigation Research.
A. R. G. Lang, G. N. Evans, and P. Y. Ho.
Aricultural Meteorology, Vol 13, No 1, p 5-13, January, 1974. 3 fig, 1 tab, 18 ref.

Descriptors: *Lysimeters, *Evapotranspiration, *Moisture content, *Advection, Australia, Semi-arid climates, Irrigation, *Rice, Radiation, Newport, Evaporation.

In a semi-arid region, evapotranspiration from a flood-irrigated rice crop was determined with lysimeters at distances of 15, 60, 290 and 790 m. downwind from the edge. The expression $E = ax(-p+b$ gave the most consistent results. This indicates, in theory, that evapotranspiration can be measured from any position in the field. The study demonstrated that for practical purposes a correction for advection must be applied if the measurement was taken at the center of the field. (McLachlin-Arizona)

COUPLING OF ENVIRONMENT TO PLANT RESPONSE: A SIMULATION MODEL OF TRANSPIRATION.
Washington State Dept. of Natural Resources, Olympia. Forest Land Management Center.
K. L. Reed, and R. H. Waring.
Ecology. Vol 55 No 1: p 62-72. 1974 Illus.

Descriptors: *Transpiration, Ecosystems, Model studies.
Identifiers: Douglas fir.

A low-resolution simulation model of transpiration was developed and run, with data from field studies in southwestern Oregon (USA). The output of the model served as a means of relating environmental variables to plant response. This relation was used to define an ordinate which, in conjunction with previously developed ecosystem ordinates, proved helpful for comparing ecosystems, predicting community composition and, in special cases, growth. The data requirements of the model are modest; we deliberately developed a model that can be used on data obtained from field studies where electric power is unavailable and use of sophisticated instrumentation is impossible. The model requires inputs of air and soil temperature, atmospheric humidity, seasonal plant water potential (expressed as plant moisture stress, the absolute value of plant water potential), and a model of stomatal behavior. Where it was impossible to obtain accurate data, stochastic models were used to provide the necessary input. The model simulated both potential and actual transpiration, the ratio of which is the most valuable single index of the seasonal moisture regime. Where no measurable stomatal control was exerted by Douglas-fir, the ratio was 1.0, indicating that adequate water was available to meet the transpiration demand. The ratio approached 0.3 on the drier locations. Significant changes in vegetation and growth were associated with this index.--Copyright 1974, Biological Abstracts, Inc.

ntifiers: *New South Wales.

ily recession constants of surface runoff, inter-w, and baseflow have been derived for 150 ods on 29 New South Wales catchments with as larger than 250 sq km. Variations of in-pretation by different analysts were shown to e a significant effect on the surface runoff ues. For the three flow components, significant ferences in recession constant values were nd between coastal and inland catchments, and se correspond with broad-scale geological racteristics. Regional median values of eflow and interflow recession constants were ived for use in design. Satisfactory relation-ps between recession constants and geological l physical characteristics of individual chments could not be found, but tentative rela-ns were presented. Published recession data m overseas were found to be comparable with New South Wales data. Derived maximum eflow and interflow discharges should provide seful adjunct to the derived recession constants interpretation of recessions and low flow racteristics. (Lardner-ISWS)

n-uniformity of local environmental conditions ds to differences in the axial orientation, length, l degree of development of individual meander ds, so that rivers vary in meander irregularity well as in sinuosity and dominant wavelength. velength estimation is therefore necessarily listical; various methods were compared for 19 tish river reaches digitized as direction series. r a given reach, mean bend length was strongly endent on the sampling interval over which h direction measurement was made. Direction ctra were not significantly polymodal, in con-st to Speight's finding,s but dominant velengths were high or infinite because of val-bends. Better wavelength estimates were ob-ed from direction-change spectra, whose sin-peaks are not systematically affected by the ice of sampling interval; lack of resolution can partly overcome by averaging estimates for dif-ent sampling intervals. Direction and direction-nge autocorrelograms were generally of nped oscillatory form, and wavelengths esti-ted from direction-change autocorrelations cor-ated closely with spectral estimates. Both velengths were nearly linearly related to chan-nel width and the square root of 1% duration discharge, irrespective of flow variability, width/depth, ratio or slope. (Lee-ISWS)

P. A. Glancy, and L. Harmsen.
Available from Supt. of Documents, GPO, Wash, DC, 20402, price $1.15. Professional Paper 930, 1975. 28 p, 28 fig, 5 tab, 9 ref.

Descriptors: *Floods, *Flood data, *Flood damage, *Sediment transport, *Nevada, Streamflow, Flow rates, Peak discharge, Hydrologic data, Runoff, Storms, Evaluation.
Identifiers: *Eldorado Canyon(Nev).

A devastating flash flood of thunderstorm origin struck Eldorado Canyon, a 22.9 sq mi drainage with a history of flooding, in southern Nevada, at about 2:30 p.m., September 14, 1974. The flood killed at least 9 people, destroyed 5 trailer homes and damaged many others, obliterated a restaurant, destroyed 38 vehicles, 19 boat trailers, 23 boats, half of the boat-docking facilities, and the gas dock. The severe runoff resulted from intense basinwide rain and hail at rates up to 3 inches of precipitation per half an hour. Peak discharge was estimated to be 76,000 cfs just upstream from the developed area near the canyon mouth. About 2,000 acre-ft of runoff reached Lake Mohave, the canyon terminus. Runoff dumped an estimated 70,000 cu yd (about 100,000 tons) of inorganic sediment on Lake Mohave and throughout the lowermost canyon reach. It also delivered an estimated 4 acre-ft of organic or floating debris to Lake Mohave. The inorganic sediment was estimated to be less than 1 percent boulders, 40 to 60 percent gravel, 20 to 40 percent sand, and 10 to 25 percent silt-clay. (Woodard-USGS)

SIMULATION OF GAMMA-DISTRIBUTED FIRST-ORDER MARKOV CHAIN,
Department of the Environment, Ottawa (Ontario). Hydrology Research Div.
V. Klemes, and L. Boruvka.
Water Resources Research, Vol 10, No 1, p 87-91, February, 1974. 1 fig, 1 tab, 9 ref.

Descriptors: *Markov processes, *Simulation analysis, Hydrology, Mathematical studies, Mathematics.
Identifiers: *Markov chain, *Gamma distribution.

Simulation of a serially correlated series with a given marginal distribution is one of the important prerequisites of synthetic hydrology and of its applications to analysis of water resource systems. The problem has, however, no fully satisfactory solution because of the difficulties in defining other than normal multivariate distributions. The gamma-distributed first-order Markov chain is one of the most useful models of this category, since marginal distributions of many hydrologic variables can be approximated satisfactorily by the gamma distribution, and the limited understanding of the sequential behavior of the process combined with the smallness of available data samples often does not warrant models more sophisticated than the first-order Markov chain. Identifiers: *Grand Lake, *Six Mile Lake, *State ownership, Legal test.

The Louisiana Supreme Court in State v. Placid Oil Co., articulated the legal test for classifying a body of water as a lake or stream. In Louisiana the state ceded ownership of the banks, or land between the ordinary high and low water marks, of navigable rivers and streams to the adjacent landowners. Regarding lakes, however, the state retained ownership of all lands below the ordinary high water mark. The issue in this case was ownership of a segment of the bank of a water body which turned on the question of whether the body of water was a stream or a lake. In prior cases the Louisiana courts had applied either an 'expanse of size' test or an 'alluvionforming current' test. The Supreme Court in the Placid Oil test merged the two tests and incorporated several additional elements to arrive at a multiple factor test. The test includes the size, shape, depth and current of the body of water. The multiple factor test will give the courts more freedom to weigh the public interest in the land when determining ownership. (Altuve-Florida)

2F. Groundwater

A GEOPHYSICAL METHOD FOR DETERMINATION OF AQUIFER PARAMETERS OF HARD ROCKS,
Central Water and Power Research Station, Poona (India).
M. Bardhan.
In: International Symposium on Development of Ground Water, November 26-29, 1973, Madras, India, Vol 1, pIb-11-Ib-21, 2 fig, 1 tab, 7 ref.

Descriptors: *Aquifer characteristics, *Aquifers, *Groundwater, Geophysics, Borehole methods, Logging(Recording), Tracers, Locating, Movement.
Identifiers: *Hard rock aquifers, Gamma-gamma logging, Neutron-neutron logging, Density logging.

Any geophysical method capable of giving all the essential aquifer parameters, namely porosity, permeability, transmissibility and specific yield, has to be a combination of techniques. In this model the objective is obtained through a tricomponent system, consisting of (1) gamma-gamma logging t delineate hard rock aquifer zones, (2) neutron-neutron logging to confirm these zones and determine their porosity, and (3) observation of the dilution of an injected tracer in the aquifer zone to determine the rate of ground water flow through them, from which the permeability and transmissability of the individual aquifers are determined. In gamma-gamma logging the quantum of measured gamma rays scattered by the formation can be translated in terms of bulk density of the medium logged. Hard rock aquifers show a lower value of bulk density. The neutron-neutron moisture logging detects the concentration of hydrogen in the formation. Thus the water table is easily located. Below the water table the measured values correspond to the effective porosity of the formation with hard rock aquifers exhibiting higher porosity than the unfractured massive rocks. Formulas for determining the flow rate in an aquifer from concentrations of dye in a formation through time have been developed. Field studies of this method have been made and the results at Kusuma dam site of the Bansagar Project, Madhya Pradesh, India are reported. The accuracy of the method is dependent on certain specific geostructural and geohydrologic conditions such as fracturing and its orientation, and is discussed. (Bradbeer-NWWA)

Descriptors: *Model studies, *Groundwater movement, *Slopes, *Seepage, Aquifers, Aquicludes, Water table aquifers, Equations, Height, Groundwater, Viscosity, Theoretical analysis, Steady flow.
Identifiers: *Hele-Shaw models, Sloping aquifers.

Experiments were conducted on a vertical Hele-Shaw model to study the effect of slope of an impermeable layer on flow profiles and flow rates in an unconfined aquifer. Experimental results were compared with the solutions of Pavlovsky (1930) and Childs (1971).for nonuniform seepage on a small sloping impermeable bed .These studies showed that the solution of Pavlosky may be used for the prediction of the flow profile downslope up to 30% slope and upslope up to 15% slope. Pavlosky's equations also predicted flow rates and normal depths satisfactorily up to 30% slope. Child's equations also predicted similar results. None of these equations predicted the flow rate on negative slope satisfactorily. (Visocky-ISWS)

GROUND-WATER RECHARGE SIMULATION,
New South Wales Univ., Kensington (Australia). Faculty of Military Studies.
A. C. Amar.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY9, Paper 11588, p 1235-1247, September 1975. 6 fig, 17 ref, 2 append.

Descriptors: *Groundwater recharge, *Simulation analysis, *Leplaces equation, *Dupuit-Forchheimer theory, *Potential flow, Groundwater, Mathematics, Equations, Unsteady flow, Recharge, Artificial recharge, Saturated flow, Numerical analysis, Mathematical studies, Free surfaces, Model studies
Identifiers: *Groundwater mounds, *Type curves, *Finite difference formulation

Formulation and solution of a two-dimensional nonlinear computational model based on potential theory pertaining to a typical groundwater recharge pattern were presented. The objective of the present study was to direct attention toward the evaluation of the theoretical model by comparing it with the corresponding linear and nonlinear models based on Dupuit-Forchheimer approximations for the unsteady hydrodynamic behavior of the proposed recharge system under saturated flow conditions. Superiority in regard to generality of its application as well as accuracy of the results obtained was demonstrated by comparing it with the pertinent experimental data and presented in the form of dimensionless graphs. Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY9, Paper 11582, p 1197-1209, September 1975. 6 fig, 2 tab, 27 ref, 2 append.

Descriptors: *Groundwater, *Aquifer characteristics, *Numerical analysis, *Unsteady flow, Aquifers, Optimization, Mathematical studies, Hydraulics, Equations, Subsurface water, Transmissivity, Mathematics, Linear programming, Analytical techniques, Diffusion, Diffusivity.
Identifiers: Inverse problem, Parameter identification.

An analysis of the inverse problem of parameter identification in unsteady groundwater flow was presented. The response of the system is governed by a typical nonlinear second- order partial differential equation for which there exists no closed form solution. Identification is an inverse process whereby the parameters embedded in a differential equation are determined from observations of the system's input and output along with appropriate initial and boundary conditions. These parameters are usually not physically measurable. A simple but illustrative inverse problem was analyzed by quasilinearization, maximum principle, gradient method, the influence coefficient method, and linear programming. A comparison was made between these methods. The problem of convergence and stability was examined and demonstrated by numerical experimentation. (Prickett-ISWS)

ifiers: Upper Colorado Region.

Upper Colorado Region covers about 113,500 in parts of Arizona, Colorado, New Mexico, , and Wyoming. Drainage from about 97 per- of the region is to the Colorado River. The ominantly arid to semiarid region averages three persons per square mile and is used ly for grazing, recreation, and mineral opment. The water supply comes from pitation which averages about 95 million acre- per year. Development of the region's water y has been limited almost entirely to surface r. Only about 2 percent of the total estimated ne of water withdrawn (about 5.7 million ft) in 1970 came directly from groundwater es. Recoverable groundwater in just the r 100 feet of saturated rocks is estimated to be illion acre-feet. That amount is nearly four the total active storage capacity of all sur- water reservoirs in the region. By the year consumptive use of water within the region ater exports to adjacent regions are expected al more than 6.5 million acre-feet per year. dard-USGS)

WISCONSIN'S GROUNDWATER: AN INVALUABLE RESOURCE,
Wisconsin Univ., Madison. Cooperative Extension Programs.
D. Stephenson, and J. W. Clark.
Report G2651, October 1974. 19 p, 12 fig, 3 maps, 9 ref.

Descriptors: *Groundwater, *Groundwater resouces, *Wisconsin, Water supply, Water resources, Hydrologic cycle, Water properties, Zone of aeration, Zone of saturation, Recharge, Groundwater recharge, Discharge(Water), Aquifers, Wells, Water wells, Water quality, Regulation, Conservation, Pollutants.

Less than 1% of the earth's water is readily drinkable. Part of this 1% occurs in rivers, lakes, and ponds, but most of the good clean water is stored in the ground. Groundwater is a precious but limited resource; its quality can be destroyed easily. As the fast-growing population makes more demands on groundwater supply, a greater effort must be made to understand and protect it. This publication, designed to be understood by the general reader, is expected to aid public officials, study groups, teachers, and citizens of Wisconsin and other states. The properties of water, the world's total water system, and the hydrologic cycle were described. Further explanation was given of groundwater flow systems. Man's use of groundwater supplies was explored, and the problems of maintaining groundwater supplies and quality in the future were described. Maps depicted the thickness of glacial deposits in Wisconsin and probable well yields from bedrock and glacial deposits in the state. (Robinson-ISWS)

NUMERICAL MODEL OF FLOW IN A STREAM-AQUIFER SYSTEM,
Colorado State Univ., Fort Collins.
C. E. K. Rovey.
Hydrology Paper No. 74, August 1975. 73 p, 36 fig, 2 tab, 23 ref, 2 append. AID/csd-2460.

Descriptors: *Groundwater, *Surface water-groundwater relationships, *Simulation analysis, *Model studies, *Numerical analysis, *Colorado, Aquifers, Mathematical models, Computer models, Aquifer management, Base flow, Groundwater availability, Water resources development, Analytical techniques, Digital computers, Alluvial aquifers.
Identifiers: *Arkansas Valley, *Finite-difference techniques, Confined-unconfined aquifers.

A three-dimensional, finite difference model was developed for simulating steady and unsteady, saturated and unsaturated flow in a stream-aquifer system. The basis of the model was a finite difference form of Richard's equation for unsaturated and saturated subsurface flow. Effects of streamflow on groundwater movement were treated by applying the appropriate boundary conditions to Richard's equation. Contributions of groundwater to river flow were quantified by including seepage rates in the computation of river discharge. The three-dimensional model was developed for use in this study to interact with two-dimensional model segments, which were interfaced with the three-dimensional model on its upstream and downstream ends. The model produced results which matched observed data for the study area, which consisted of a 40-mile reach of the Arkansas Valley of southeastern Colorado. Computed estimates of river discharge at each end of the study area and water table elevations throughout the region agreed reasonably well with observed data. An analysis of the sensitivity of results produced by the model to variation in the values of several input parameters was included as part of the study. (Prickett-ISWS)

ENVIRONMENTAL ISOTOPIC STUDY OF THE BARREMIAN-JURASSIC AQUIFER IN SOUTH DOBROGEA (ROUMANIA),
Institutul de Meteorologie si Hidrologie, Bucharest (Rumania).
A. Tenu, P. Noto, G. Cortecci, and S. Nuti.
Journal of Hydrology, Vol. 26, No. 3/4, p 185-198, August 1975. 6 fig, 1 tab, 26 ref, 1 append.

Descriptors: *Isotope studies, *Groundwater movement, *Limestones, Aquifers, Carbonates, Oxygen isotopes, Carbon radioisotopes, Radioactive dating, Surface waters, Distribution patterns, Recharge, Deuterium, Velocity, Paleoclimatology, Mixing, Correlation analysis.
Identifiers: *Roumania, Danube River, Black Sea, Siutghiol Lake, SMOW(Standard Mean Ocean Water), PDB(Pee-Dee-Belemnite) standard.

The Barremian-Jurassic limestones represent the main groundwater aquifer supplying the South Dobrogea region. The waters from this aquifer have delta 018 and delta D values ranging from -12.8 to -11.0% and from -78.8 to -64.6% respectively, relative to SMOW. The delta C13 range is narrow, from -9.2 to -6.7% relative to PDB, while the C14 contents give corrected ages from 201 to 24,353 years. These data and their areal distributions in comparison with that of surface waters (Danube River, Siutghiol Lake, and Black Sea) have shown that: (1) the recharge area is on the west side of the region (in Ostrov district and to the south of it), and (2) the flow direction in the aquifer is WSW-ENE towards Siutghiol Lake. The water flow shows a unidirectional pattern on the west side with a constant velocity of 6.87 m/yr. There is a radial-divergent flow pattern on the east side, where the velocity of the main flow towards the lake is on the average 4.67 m/yr, while along a secondary direction it is 2.87 m/yr. Identifiers: *South Australia, Padthaway-Keppoch Irrigation District, Naracoorte Range, Streamlines, Conceptual model, Piston flow, Fully mixed flow.

The tritium concentration of groundwater samples has been used to estimate the amount of water moving laterally into an aquifer as well as the quantity of local recharge. A multicompartment model used to calculate the variation of tritium concentration within the aquifer predicts that the lateral input of water is 24,000,000 cu m/yr, while local recharge is 27 mm/yr. These results are compared with conventional hydrogeological estimates of 18,000,000 cu m/yr and 70 mm/yr, respectively. (Visocky-ISWS)

MATHEMATICAL SIMULATION OF GROUNDWATER ABSTRACTION FROM CONFINED AQUIFERS FOR RIVER REGULATION,
Department of the Environment, Reading (England). Central Water Planning Unit.
A. B. Birtles, and W. B. Wilkinson.
Water Resources Research, Vol. 11, No. 4, p 571-580. August 1975. 13 fig. 17 ref.

Descriptors: *Groundwater, *Surface-groundwater relationships, *Simulation analysis, *Model studies, *Base flow, Aquifers, Mathematical models, Computer models, Numerical analysis, Aquifer management, Springs, Subsurface runoff, Water resources development, Analytical techniques, Digital computers, Flow nets.
Identifiers: *Finite difference method, *Implicit method.

The development of an initially confined aquifer for river regulation was considered. Model investigations covered a range of groundwater abstraction regimes and a number of aquifer systems typical of those found in the United Kingdom. The various factors affecting net gains were discussed. The main conclusions were that high net gains would be sustained only if unconfined storage was developed around the abstraction site. In practice this requires a high density of abstraction wells. Also, higher net gains could be obtained from those aquifers having a large response time. (Prickett - ISWS)

SOIL CRUSTS.
Arizona Agricultural Experiment Station, Tucson. Technical Bulletin 214, (1974), 58 p. 192 ref. Edited by J. W. Cary and D. D. Evans.

Descriptors: *Soil physical properties, *Soil surfaces, *Soil management, *Soil cements, Soil strength, Soil sealants
Identifiers: *Soil crusts, Cementing agents.

This publication is based on the research conducted by the scientists associated with the Wester Regional Research Project W-66 during the period 1964 to 1970. Significant progress was made toward understanding and improving the management of crusting soils; since the subject is relatively narrow, it was possible to cover most aspects of crusting in a single publication. The first chapter is written for a broad audience, including all those who are faced with practical problems involving soil crusts. Chapters 2 through 5 are more detailed, and provide the technical background required for in-depth understanding of soil crust behavior. In addition to the information presented in this bulletin that has not been previously published, a rather extensive review and discussion of appropriate literature has also been included. (See W76-00518 thru W76-00524)

MANAGEMENT OF CRUSTING SOILS: SOME PRACTICAL POSSIBILITIES,
Colorado State Univ., Fort Collins. Engineering Research Center.
W. D. Kemper, and D. E. Miller.
In: Soil Crusts, Arizona University Agricultural Experiment Station, Technical Bulletin 214, 1974. p 1-6, 3 fig. J. W. Cary and D. D. Evans, eds.

Descriptors: *Soil physical properties, *Soil surfaces, *Hydraulic conductivity, *Organic matter, *Vegetation effects, Runoff, Erosion, Soil management, Plant growth, Soil water movement, Bulk density, Cover crops, Irrigation, Mulching, Cultivation, Surface sealing.
Identifiers: *Soil crusts.

Soils with low organic matter and high silt content usually have low aggregate stabilities which are commonly associated with soil crusting. High levels of sodium make these problems even more severe. Soils with higher organic matter contents (2 or 3 percent or more) are less susceptible to crusting which is attributed to long organic molecules acting as glues holding particles together in fairly stable aggregates. Organic matter may also reduce swelling pressure forces and wetting rates, and modify surface tension forces. A permanent cover crop, such as grass, increases soil organic matter, but much is lost under row crop conditions because of exposure of new surfaces and accelerated microorganism decomposition. MODIFICATION OF SOIL CRUSTS FOR PLANT GROWTH,
Agricultural Research Service, Prosser, Wash. Irrigated Agriculture Research and Extension Center.
D. E. Miller, and R. O. Gifford.
In: Soil Crusts, Arizona University Agricultural Experiment Station, Technical Bulletin 214, p 7-16, 1974, 4 fig, 3 tab. J. W. Cary and D. D. Evans, eds.

Descriptors: *Soil physical properties, *Plant growth, *Mulching, *Soil compaction, *Vegetation establishment, Soil surfaces, Hydraulic conductivity, Runoff, Erosion, Soil management, Soil water movement, Irrigation, Cultivation, Soil properties, Surface sealing, Soil moisture.
Identifiers: *Seedlings, *Soil crusts.

Probably the most important effect of soil crusts is on emergence and early development of seedlings. Also, seedlings may be injured by soil movement during cultivation of a crusted soil. Reducing water drop impact by surface mulches or reducing the water drop momentum by reducing droplet size and application rates are methods of preventing crusts. A group of seedlings has a better chance of crust penetration than does a single seedling and keeping the soil moist during seedling emergence will decrease crust strength. VOID CHANGES IN ALLOPHANE SOILS DETERMINING WATER RETENTION AND TRANSMISSION,
Macdonald Coll., Montreal (Quebec). Dept. of Soil Science.
T. Maeda, and B. P. Warkentin.
Soil Science Society of America Proceedings, Vol 39, No 2, p 398-403, May-June 1975. 13 fig, 2 tab, 17 ref.

Descriptors: *Soil water movement, *Retention, *Voids, *Diffusivity, *Drying, Compacted soils, Saturation, Hydraulic conductivity, Infiltration, Porosity, Bulk density, Wet climates, Clays, Porous media, Shrinkage, Laboratory tests.
Identifiers: *Allophane soils, *West Indies, *Japan, Amorphous clays, Soil columns.

Water retention and transmission were measured on eight samples of allophane soils from the West Indies and Japan. Standard methods of pressure plate, horizontal infiltration, and steady-state horizontal flux were used. Soils with high allophane content had a sigmoid water content vs. log suction curve. Drying did not change the shape of the curve, but decreased the water content at any suction. Soils with low allophane content showed a more linear water content vs. log suction curve, resembling that of clay soils with crystalline minerals. Water tranmission in undried allophane soils was slow because of the high proportion of microvoids. Air-dried or oven-dried samples had a higher proportion of macrovoids, and more rapid infiltration of water. This change in void size distribution was large enough to dominate the effect of greater volume of voids to be filled with water in an initially dry soil, with the result that water movement in allophanes increased as initial water content decreased. (Schicht-ISWS)

HYDROSALINE REGIME OF SOME SOILS IN THE MIDDLE PART OF THE CALMATUI RIVER BASIN. (IN RUMANIAN),
Institutul de Studii si Cercetari Pedologie, Bucharest (Rumania).
G. Obrejanu, G. Sandu, N. Rudzic, S. Nastea, and G. Cosma.
An Inst Stud Cercet Pedol. 39 p, 445-459. 1971 Illus. English summary.

Descriptors: Soils, Soil types, *Saline soils, *River basins, Europe, Soil groups, *Chernozems, *Soil investigations, *Salinity, Percolation, Leaching, Irrigation effects.
Identifiers: Calmatui River, Hydro selinity, Solonchak, Solonetz.

The hydrosaline regime of 3 representative genetic soil types located in the middle part of the Calmatui river basin was studied between 1963-1969. The soils were: low-terrace chernozem salinized and solonized in depth of the profile; cropped solonetz and solonetz-solonchak. Soil water regime was represented by chronoisopleths given on available water categories, while the salt regime was represented by chronizopleths of mineral residue. Evolution of water and salt regimes in the soil profile is presented, and their strong relationship is stressed. The positive influence of tillage works on both soil hydrosaline regime and soil-forming process direction is emphasized. The terrace chernozem salinized and solonized in depth of profile possess an alternating, percolative, desuctive hydrosaline regime with salts accumulation at depth. Under the influence of tillage, columnar solonetz exhibits a hydrosaline regime characteristic to periodically irrigated, cropped soils with an intense desalinizating percolation. The solonetz-solonchak is characterized by an un-percolative-exudative hydrosaline regime in the upper part, while weakly desuctive, at depth. Under the influence of both drainage canals and vegetation the hydrosaline regime became percolative-exudative with alternating periods of leaching and upward movement of soluble salts. EFFECT OF DAILY IRRIGATION ON WATER CONTENT AND SUCTION PROFILES IN SOILS OF THREE TEXTURES,
Agricultural Research Service, Prosser, Wash. Western Region.
D. E. Miller.
Soil Science Society of America Proceedings, Vol 39, No 3, p 512-515. May-June 1975 5 fig, 5 ref.

Descriptors: *Irrigation effects, *Soil texture, *Soil water movement, *Soil types, *Moisture tension, Drainage effects, Evapotranspiration, Irrigation, Irrigation efficiency, Plant growth, Soil physical properties, Soil properties, Soil-water-plant relationships, Moisture content, Soil moisture, Soil profiles, Infiltration, Soil types, Hydraulic conductivity.

Soil irrigated to replace just evapotranspiration losses produced profiles that depended upon the flow characteristics of the soil. In Shano silt loam in which the water moved readily, water distribution was nearly uniform with depth and did not change time. In soils in which water moved slowly, either because of slow internal water movement when wet (Ritzville loam) or low unsaturated conductivities at relatively low suctions (Sagehill sand), the upper soil became wetter while the lower soil water decreased by a corresponding amount. With the soil profile initially wet, several weeks of deficit irrigation passed before surface soil water content changed markedly. (Robinett-Arizona)

Identifiers: Wetting angle, Water repellent soils.

Soils on typical Arizona chaparral sites showed water repellence both before and after fire. Field and laboratory fires caused major changes in the water repellency of 4 natural soil layers, with relatively cool fires causing repellency at the surface and hot fires producing repellence at a greater depth but rendering the surface layer completely wetable. Measurement of the wetting angle of soil layers from progressively hotter fires made it possible to determine temperatures where water-repellent layers are first formed and then destroyed. Volatilization and subsequent loss to the atmoshpere is believed to be an important part of the loss of organic matter which decreased at the progressively higher temperatures. At temperatures above 270 C, the material causing water repellence is almost completely lost while below 270 C sufficient material is trapped and condensed on exchange sites to produce water repellence. IRRIGATION METHOD AS A DETERMINANT OF LARGE PORE PERSISTENCE AND CRUST STRENGTH OF CULTIVATED SOILS,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
W. D. Kemper, J. S. Olsen, and A. Hodgdon.
Soil Science Society of America Proceedings, Vol 39, No 3, p 519-523, May-June 1975. 6 fig, 1 tab, 6 ref.

Descriptors: *Wetting, *Air entrainment, *Irrigation systems, *Soil surfaces, *Soil physical properties, Hydraulic conductivity, Infiltration, Permeability, Interstices, Soil properties, Soil structure, Soil types, Wettability, Aeration, Saturated soils, Soil gases, Irrigation, Pores, Capillary conductivity, Pore pressure, Flooding, Soil aggregates, Saturation, Capillary action.
Identifiers: Crust strength, Modulus of rupture, Seedling emergence.

Air dried soils were wetted by flooding, immersion, slow immersion and capillary action resulting in successively slower rates of wetting. Slow capillary wetting of a weekly structured soil allowed retention of more large size pore space than did rapid wetting of a well structured soil. Breaking strength of dried soils which had been wet by rapid immersion, capillary action, and capillary action followed by immersion, was much greater for soils wet by rapid immersion. Immersion following slow capillary wetting resulted in soils with intermediate breaking strengths. A study on corn (Zea mays L.) seedling emergence from a weakly structured soil showed less than 50% emergence for flooding and up to 100% for capillary wetting. (Robinett-Arizona)

COMPUTER MODELING OF NITROGEN TRANSFORMATIONS IN SOILS,
California Univ., Davis. Dept. of Water Science and Engineering.
M. Mehran, and K. K. Tanji.
Journal of Environmental Quality, Vol 3, No 4, p 391-395, October-December, 1974. 7 fig, 1 tab, 20 ref.

Descriptors: *Nitrification, *Denitrification, *Model studies, *Nitrogen, Computer models, Soil profiles, Soil investigations, Water pollution sources.

A nitrogen-transformation model was formulated for simultaneous computation of various N transformations: nitrification, denitrification, mineralization, immobilization, ion exchange, and plant uptake. These processes were assumed to obey first-order kinetics. Differential equations that describe the above processes are solved simultaneously by using the 4th-order Runge-Kutta method and the Adams-Bashforth-Moulton predictor-corrector equations. The computer model was tested against data reported from several incubation studies. This model could be linked to a transport model to predict the temporal and spatial distribution of various N species in soil profiles. (Skogerboe-Colorado State)

NITRATE OCCURRENCE IN SOME SOILS WITH AND WITHOUT NATRIC HORIZONS,
Illinois Univ., Urbana. Dept. of Agronomy.
E. P. Gentzsch, E. C. A. Runge, and T. R. Peck.
Journal of Environmental Quality, Vol 3, No 1, p 89-94, January-March, 1974. 1 fig, 5 tab, 14 ref.

Descriptors: *Nitrates, *Nitrogen, *Soil properties, *Soil horizons, Soil investigations, Fertilization, Fertilizers, Groundwater, Water quality, *Illinois.
Identifiers: Natric horizons.

The effect of animal activity and fertilizer practices on the nitrate content in soils with and without natric horizons was investigated in a field study in southern Illinois where excessive groundwater nitrate levels were reported. Most of these soils are poorly drained. A comparison is provided by the poorly and well-drained soils without natric horizons observed in central Illinois. The results indicate that soils with natric horizons at shallow depths or dark-colored poorly drained soils had

evels of nitrate in the profile; all other soils ing increased nitrate levels in the entire le or below the root zone were related to the nt of fertilizer used or the amount of animal ity. Animal operations resulted in larger nts of nitrate in similar soil profiles than did izer applications. Increased nitrate content of round water, sampled in Washington County, rly was related to fertilizer practices and l activity in all soils, except under soils with horizons at shallow depths. A DEPENDENT DOMAIN MODEL OF CAPILLARY HYSTERESIS,
Technion-Israel Inst. of Tech. Haifa. Faculty of Civil Engineering.
Y. Mualem, and G. Dagan.
Water Resources Research, Vol. 11, No. 3, p 452-460, June 1975. 15 fig, 7 ref, 2 append.

Descriptors: *Hysteresis, *Capillary water, *Capillary fringe, *Mathematical models, Model studies, Wetting, Drying, Soil moisture, Soil water, Hygroscopic water, Pores.
Identifiers: *Hysteretic loop, *Dependent domain model, Drying curves, Wetting scanning curves, Drying scanning curves, Wetting curves, Pore blockage.

A model of capillary hysteresis which takes into account the phenomenon of blockage against air (and water) entry was presented. The model was based on our previous (1974) model II, which predicts any hysteretic path with the aid of two functions, L(Psi) and H(Psi). The model was generalized by adding a new function of pore blockage against air (and a function of pore blockage against water), as has been suggested by D. H. Everett (1967) and G. C. Topp (1971). It was found that the function of pore blockage against water is of a lesser significance and can be neglected in most cases. A technique of deriving L(Psi), H(Psi), and the function of pore blockage against water from the measured boundary loop and one primary drying scanning curve was presented. A simple method of predicting any hysteretic path was suggested. It was found that the generalized model leads to better results than the models based on independent domain theories for soils having a major portion of their hysteretic loop in the range of air entry value. EFFECT OF WIND STRESS ON STRATIFIED DEEP LAKE,
Technical Univ. of Denmark, Lyngby. Inst. of Hydrodynamics and Hydraulic Engineering.
N-E. O. Hansen.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY8, Paper 11484, p 1037-1052, August 1975. 7 fig, 19 ref, append.

Descriptors: *Lakes, *Entrainment, *Stratified flow, *Mixing, Winds, Stratification, Velocity, Currents(Water), Dispersion, Diffusion, Density, Turbulence, Analysis, Hydraulics.
Identifiers: *Wind shear.

The basic equations for wind-driven flows in deep two-layered lakes were outlined. The deepening of the upper layer due to entrainment of more dense water from the lower layer were explained physically, and the entrainment was related to the wind shear stress at the water surface and an overall Richardson number. The general shapes of the distributions of shear stress and velocity were outlined. Diffusion and dispersion coefficients were calculated and related to the depth of the upper layer and to the wind shear stress at the surface. (Adams-ISWS)

Evaporation, Precipitation(Atmospheric), Evapotranspiration.
Identifiers: *Lake Wingra basin(Wis)

A water budget was prepared to identify the components of the hydrologic system in the Lake Wingra basin, Wisconsin. The Lake Wingra basin, which includes a small eutrophic lake within the city of Madison is partly a protected area and parly an urbanized area. Measured and estimated inflow and outflow to and from the lake in 1 year (June 1972 and May 1973) was about 4.5 metres (15 feet)--approximately twice the volume of the lake. Inflow to the lake is about 25 percent from direct precipitation on the lake surface, and the rest from nearly equal amounts of surface runoff and groundwater inflow. Outflow from the lake is about 10 percent groundwater outflow, 15 percent evaporation from the lake surface, and 75 percent discharge at the surface outlet. Increased withdrawal of water from municipal and industrial wells in Madison has slowed the rate of flow through the lake. The calculated 1972 water budget for the lake showed gains of about 3,560 millimetres (140 in.) and losses of about 3,500 millimetres (138 in.). A discrepancy of about 60 millimetres (2 in.) probably was caused in part by uncertainties in groundwater inflow and outflow and by evapotranspiration and groundwater inflow in the marsh area southwest of the lake. THE INFLUENCE OF FISH ON THE DISTRIBUTION OF CHAOBORUS SPP. (DIPTERA) AND DENSITY OF LARVAE IN THE MATAMEK RIVER SYSTEM, QUEBEC,
Waterloo Univ. (Ontario). Dept. of Biology.
G. F. Pope, J. C. H. Carter, and G. Power
Trans Am Fish Soc, Vol 102, No 4, p 707-714, 1973. Illus

Descriptors: *Lakes, *Fish food organisms, Diptera, Canada.
Identifiers: Chaoborus, Matamek River(Quebec), Scandanophasma.

The distribution and limnetic density of 5 spp. of Chaoborus larvae were determined in 26 lakes of the Matamek River System, Quebec, Canada. The distribution of C. Americanus is closely related to the absence of fish while C. punctipennis is associated with fish populations. The distributions of C. trivittatus and C. flavicans appear independent of the presence of fish, but C. flavicans reaches its greatest density in the 3 lakes with the largest basins. A probable new species or subspecies of the subgenus Scadanophasma was found in 3 lakes. The standing crop of limnetic Chaoborus larvae is higher in lakes without fish than with fish.--Copyright 1974, Biological Abstracts, Inc

I. R. Smith, and I. J. Sinclair.
Freshwater Biol, Vol 2, No 4, p 387-399, 1972, Illus.

Descriptors: *Waves(Water), *Lakes.

The properties of waves on a lake surface and the influence of water depth on these properties are discussed. The method, derived by the Beach Erosion Board, of predicting wave characteristics if the wind speed and fetch are known is outlined and the validity of the method in Loch Leven, Scotland, is confirmed. This prediction technique is then combined with the equations of classical hydrodynamics to form a method of assessing the nature and extent of wave action in lakes without direct measurement. The value of the ratio of the wave-mixed volume to the total lake volume as a measure of hydraulic conditions in lakes is suggested.--Copyright 1973, Biological Abstracts, Inc.

THE ROACH (RUTILUS RUTILUS L.) FROM THE DAM RESERVOIR IN PRZECZYCE, POLAND,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
S. Skora.
Acta Hydrobiol, Vol 14, No 4, p 399-418, Illus, 1972.

Descriptors: *Algae, Reservoirs, *Fertility, Aquatic insects, *Fish food organisms, Fish, Larvae.
Identifiers: *Poland(Przeczyce), *Roach, Rutilus-rutilus.

The body length, body weight, growth, age, variability of 30 morphological features of the body, variability of meristic features and fertility of 205 specimens of the roach from the dam reservoir in Przeczyce (Poland) were examined. The contents of the alimentary canal of this fish were analyzed. The growth of the examined fish, in comparison with that of this species in other reservoirs, was considered fair. A decrease and equalization of relative variability of morphological features is similar to that in other fish. Meristic features did not deviate from the standard adopted for the roach. Individual variations of fertility of females were considerable and ranged from 12,480--334,464 eggs/female. Larvae of insects and filamentous algae constituted the main components of the content of the alimentary canal of the roach.--Copyright 1974, Biological Abstracts, Inc.

ECOLOGY OF THE LAKE FROG IN SOUTH-EASTERN KAZAKHSTAN. (IN RUSSIAN).
Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Institut Zoologii.
Izv Akad Nauk Kaz SSR Ser Biol. 1. p 52-57. 1973.

Descriptors: *Frogs, Amphibians, Wildlife, Animal growth, *Animal behavior, Lakes.
Identifiers: Ecology, Frog, Hibernation, Kazakhstan, Rana-ridibunda, USSR, Ili River.

Naturalistic observations of Rana ridibunda in the Ili River and Alma-Ata in 1968-1969 were compared with data obtained in other regions of southeastern Kazakhstan in 1952-1962. The lake frog propagates and develops in the low temperature regime of artificial reservoirs in this region, and this permits extension of its area of distribution from the south-east to the north-east. Adaptation of the southern species to marked temperature fluctuations permits tadpoles to hibernate at an early age in cold waters. Adult specimens eat mainly insects; harmful insects with larvae account fo 42%. Vertebrates account for 1-3%. R. ridibunda may be considered a useful species in south-eastern Kazakhstan.--Copyright 1974, Biological Abstracts, Inc.

Australian Journal of Agricultural Research, Vol 26, No 3, p 447-457, May, 1975. 8 fig, 4 tab, 21 ref.

Descriptors: *Grasses, *Semiarid climates, *Growth rates, *Plant physiology, *Moisture stress, Plant growth, Plant growth substances, Productivity, Soil-water-plant relationships, Water requirements, Air temperature, Soil moisture, Moisture availability, Phosphorus, Nutrients.
Identifiers: Mulga grass(Thyridolepis mitchelliana), Hoop Mitchell grass(Astrebla elymoides), Buffel grass(Cenchrus ciliaris L.).

The effects of temperature and soil water supply on mulga grass (Thyridolepis mitchelliana (Ness) S. T. Blake), hoop Mitchell grass (Astrebla elymoides F. Muell.ex F. M. Bailey) and buffel grass (Cenchrus ciliaris L.) are discussed. The optimum temperature for growth was about 25C for mulga grass, and 30C for Mitchell and buffel grass. Buffel grass had the highest yield at all temperatures which is attributed to its higher growth rate, higher assimilation rate and the diversion of a greater proportion of dry weight into leaf area. Seedlings with an adequate supply of phosphate had higher relative growth rates than phosphorus-deficient seedlings at the commencement of the soil drying cycle, but their growth rates declined more rapidly as soil water potential fell. This was associated with a reduction in the rate of phosphate absorption as well as a decrease in tissue phosphorus concentration. (Robinett-Arizona)

WATER POTENTIALS OF SALSOLA KALI L. AT DIFFERING LEVELS OF SUBSTRATE WATER AVAILABILITY,
Forest Service (USDA), Odgen, Utah. Intermountain Forest and Range Experiment Station.
W. T. McDonough.
Plant and Soil, Vol 42, No 2, p 387-393, April, 1975. 3 fig, 7 ref.

Descriptors: *Plant physiology, *Germination, *Plant growth, *Water requirements, *Turgidity, Growth stages, Moisture stress, Plant growth, Water balance, Moisture availability, Moisture uptake, Osmotic pressure, Hygrometry, Moisture content, Root development, Plant tissues, Weeds, *Utah.
Identifiers: Water potential, *Russian thistle(Salsola Kali L.), Wasatch Range(Utah).

Isolated embryos of Salsola Kali L. (Russian thistle) were allowed to imbibe on filter paper in Peltier thermocouple psychrometer chambers with differing amounts of water available. Water potential determinations made on the system periodically during the 24 hour period of imbibition showed that at the 24th hour, complete extension of the embryonic axis occurred at an equilibrium water potential of -2 bars and an embryo water content of 114%, perceptible growth (uncoiling of the spiraled embryo) at -30 bars and 83%, and no growth or perceptible swelling at -54 bars and 56%. In Salsola, evidence of growth occurs at water potentials well below those that permit germination in other species investigated, and extensive growth occurs in about the same range as root protrusion in the other species investigated. Hourly monitoring of the water potential of the plant-substrate system showed an initial rise toward a level that would be attained by the wetted filtered paper alone and then a decline to lower water potential values at intermediate levels of water availability. This reversal is ascribed to the increasing effects of the osmotic and matric components of the total water potential of the plant tissue during imbibition and growth. (Robinett-Arizona)

DROUGHT TOLERANCE OF PINE SEEDLINGS UNDER VARIOUS CLIMATIC CONDITIONS,
Agricultural Research Organization, Dor (Israel). Div. of Forestry.
D. Heth, and P. J. Kramer.
Forest Science, Vol 21, No 1, p 72-82, March, 1975. 5 fig, 5 tab, 25 ref.

Descriptors: *Osmotic pressure, *Moisture stress, *Plant physiology, *Pine trees, *Plant growth, Leaves, Drying, Turgidity, Moisture availability, Transpiration, Droughts, Arid lands, Loblolly pine trees, Planting management, Temperature, Thermal stress, Humidity, Soil moisture, Soil-water-plant relationships.
Identifiers: Shortleaf pine(Pinus echinata), Monterey pine(Pinus radiata D. Don), Pinus taeda L.

The ability to avoid severe desiccation during periods of increasing soil moisture stress is critical for survival of drought by pine seedlings. Tolerance of water stress by seedlings was evaluated under 4 combinations of temperature and humidity in controlled environment chambers. The survival ability of seedlings after cessation of watering was strongly related to temperature and humidity; survival being highest in the most cool environment and lowest in the hot dry environment. Soil water potential at seedling death was lowest for Monterey pine (Pinus radiata D. Don) in all 4 environments and lowest in the moist cool environments. Soil water potential at seedling death was lowest for shortleaf pine (P. echinata) and loblolly pine (P. taeda L.) in the moist warm environment. Monterey pine appeared to be most drought tolerant as measured by soil water potential at seedling death in all but the moist warm environment in which there was little difference among the 3 species. Descriptors: *Stomata, *Water loss, Drought, Tolerance.
Identifiers: Fraxinus Americana, Populus Grandidentata, Populus Tremuloides.

Leaf resistance to water vapor flow was determined relative to leaf-water potential for white ash, quaking aspen, and bigtooth aspen (Fraxinus americana, Populus tremuloides, P. grandidentata). Ash leaves were found to close their stomata at approximately -20 bars and bigtooth aspen leaves at approximately -30 bars, whereas quaking aspen maintained low leaf resistance to -60 bars. This lack of control of water loss is suggested as a possible reason for the apparent moist site preference for quaking aspen in the study region. Bigtooth aspen may be able to survive in more xeric habitats than ash because of the latter's high leaf-water potential for stomatal closure.--Copyright 1974, Biological Abstracts, Inc.

PATHOLOGICAL CHANGES OBSERVED IN FISHES FOLLOWING POISONING BY GRANULATED HERBICIDES-ATRAZINE AND DIURON: RAPID DETERMINATION OF THE TOXICITY OF LOW PESTICIDE CONCENTRATIONS (IN RUSSIAN),
K. R. Martino.
Tr Kasp Nauchno-Issled Inst Rybn Khoz, 26, p 245-249, 1971.

Descriptors: *Fish, Pesticides, *Fishkill, *Herbicides, Diseases, Fish diseases, *Pesticide toxicity.
Identifiers: Atrazine, Diuron, Granulation herbicides, Liver, Rudd, Scardinius-erythrophthalmus, Necrosis.

The effect of low concentrations of the granulated herbicides atrazine and diuron on the rud (Scardinius erythrophthalmus) was studied. The experiments were set up under aquarium conditions using fish in the IV and V stages of maturity. Change of behavioral sterotypes were determined on the basis of 4 indices: defense reflex, response to food, localization of the fish in the bottom or surface waters, and presence or absense of the schooling instinct. At the end of 8-9 days the fish were subjected to hematological and pathohistological investigations. At the minimum tested concentrations of atrazine and diuron (0.64 mg/l) the behavior of the experimental fish did not differ from that in controls. However, destruction of erythrocytes was noted in the blood and edema and cloudy swelling progressing to necrosis were observed in the liver. The experiments demonstrated the unsuitability of these herbicides for fish farms and the possibility of rapid determination of the toxicity of various pesticides.--Copyright 1974, Biological Abstracts, Inc.

SOME EFFECTS OF SOIL TYPE AND WATER REGIME ON GROWTH OF TUPELO SEEDLINGS,
Forest Service (USDA), Charleston, S.C. Southeastern Forest Experiment Station.
W. R. Harms.
Ecology, Vol 54, No 1, p 188-193, 1973, Illus.

Descriptors: *Soil water plant relationships, Soil water, Plant growth, Stagnant water.
Identifiers: Nyssa aquatica, Nyssa sylvatica, Tupelo, Tree seedlings.

Two year-old swamp tupelo (Nyssa sylvatica var biflora (Walt.) Sarg.) and water tupelo (N. aquatica L.) grown in large tanks in a silty clay loam soil from a river swamp or a sandy loam soil from a non-alluvial headwater swamp were subjected to continuous flooding at depths of 20 cm above the soil surface with moving water, 20 cm above the soil surface with stagnant water, or at the soil surface with moving water. Height growth of water tupelo averaged 1.8 times greater and dry weight 3 to 3 times greater in the more fertile soil from the river swamp than in soil from the headwater swamp. Soil type had no effect on growth of swamp tupelo. Growth and dry weight of both tupelos were poorest in the regime with stagnant water, which also had the highest CO2 and lowest O2 contents. Swamp tupelo grew 50 cm more in height in the surface flooded regime with moving water than in either deep-flooded regime. Water tupelo in both regimes with moving water grew 3 cm taller than those in the stagnant regime.--Copyright 1973, Biological Abstracts, Inc.

A DUAL-INTERVAL, LIGHT-ACTIVATED SIGNAL GENERATOR--ITS APPLICATION TO SEDIMENT SAMPLING,
Agricultural Research Service, Chickasha, Okla.
C. D. Edens, and D. G. DeCoursey.
Transactions of the American Society of Agricultural Engineers, Vol 18, No 3, p 505-507, May-June 1975. 4 fig, 1 tab.

Descriptors: *Instrumentation, *Sediment, *Sampling, Measurement, Data collection, Hydrologic data, Water table, Electronic equipment, Water levels.
Identifiers: Optical instruments, Light-activated devices, Signal generator.

Since records of sediment in the field are not available on a continuous basis, water samples must be collected periodically and analyzed for concentration. The device described was less expensive improvement over available stage and time-activated methods of determining when samples should be taken. To signal the sampler, the device uses light-sensitive rectifiers, activated by light shining through the holes in a disc mounted on the stage recorder. (Lee-ISWS)

EROSION IN THE URBAN ENVIRONMENT,
Johns Hopkins Univ., Baltimore, Md.
M. G. Wolman.
Hydrologic Sciences Bulletin, Vol 20, No 1, p 115-125, March 1975. 1 tab, 17 ref.

Descriptors: *Erosion, *Erosion rate, *Urbanization, *Sedimentation, Urban runoff, Rill erosion, Sheet erosion, Soil erosion, Channel erosion, Sediment load, Water quality, Turbidity, Erosion control, Sediment yield, Construction, Urban hydrology, Environmental effects, Land development.

Urbanization and accompanying construction increase erosion rates from five to 200 times or more in the eastern United States. Sediment yields of streams increase by comparable amounts. Data from the United Kingdom, Japan, Canada, and Mexico suggest roughly similar ranges. Increased discharge from urban areas combined with increases in sediment concentration on the order of 2 to 50-fold are demonstrated in individual storms and in seasonal and annual variations in the United Kingdom. Potential for erosion below dams parallels a similar potential from urbanized areas af

ion. Nomograms relating area under con-
, basin area, and erosion rates provide

ALKALINITY CALCULATIONS IN WATER,
Kiriat-Yam 'G', Haifa (Israel).
A. Zonker.
Water and Sewage Works, Reference Number, p R162-R163, April 30, 1975. Revised by H. G. Swope. 1 fig, 1 tab, 1 ref.

Descriptors: *Analytical techniques, *Water analysis, *Alkalinity, Chemical analysis, Bicarbonates, Carbonates, Alkalis(Bases), *Volumetric analysis, Pollutant identification.
Identifiers: Nomagraphs.

The simple, classical method of alkalinity determination in water is based on double titration with acid. Phenolphthalein and methyl orange are used to indicate the titration end points. A well known table of values may be obtained by using 100 ml of water an 0.02N acid as a titrant, and determining P as the quantity of acid consumed from the beginning to the phenolphthalein end point, and T as the quantity of acid consumed from he beginning to the methyl orange end point. A nomograph is presented which includes these possibilities. By connecting the known values of P and T, one can determine the concentration of hydroxides, carbonates, and bicarbonates. Several examples are give. Since the nomograph is based on a 100 ml sample and 0.0200N acid, care must be taken to insure that the test acid has the exact normality and corrections must be made for samples of less than or more than 100 ml. 2L. Estuaries

AN OCEANOGRAPHIC RESEARCH PROGRAM FOR THE CONTINENTAL SHELF OFF THE SOUTHEASTERN UNITED STATES.
Division of Biomedical and Environmental Research (USERDA), Washington, D.C.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Available from the National Technical Information Service, Springfield Va 22161. ERDA-12, Proceedings of the Workshop, Savannah River Laboratory, Aiken, South Carolina, October 8-9, 1974. 35 p, 2 fig.

Descriptors: *Oceanography, *Continental shelf, *Oceans, *Southeast U. S., Continental slope, Atlantic Ocean, Marine biology, Ocean circulation, Ocean currents, Physical properties, Tides, Estuaries, Sediment transport, Nutrients, Environmental effects, Radioactivity, Offshore platforms, Background radiation, Project planning, Project feasibility, Planning, Research priorities, *Research and development.
Identifiers: Offshore nuclear powerplants.

On October 8-9, 1974, 41 oceanographers from the southeastern United States gathered at the Savannah River Laboratory, Aiken, South Carolina, to recommend the elements of a unified research program that would contribute to a better understanding of the ocean system over the continental shelf south of Cape Hatteras. The effort was an experiment with two objectives: (1) to bring together a cross-section of oceanographers familiar with the existing and past oceanographic research on the southeastern continental shelf and to allow some interaction across the disciplines; and (2) to provide guidance to the AEC and its successor, the Energy Research and Development Administration (ERDA), on what types of oceanographic research programs could be reasonably undertaken in the southeast with constraints in funding and time. Four groups were formed: Physical Oceanography, Sediment Transport, Geochemical Transport, and Biological Oceanography. The ultimate long-term objective for ERDA is to fund research programs that would assess the impact of offshore nuclear power reactors and other energy-related activities in the environment of the southeastern continental shelf. However, the working objective of the groups in the workshop was to design a research program that would enhance our understanding of the system. This is prerequisite for separating out the abnormal working of the system caused by man-made impact from the 'normal' working of the system before energy-related activities are initiated. Each group was requested to place priorities on the scope of their research, implying recognition, a priori, that every conceivable problem could not be attacked in depth. (Sims-ISWS)

THE MEDITERRANEAN OUTFLOW--A SIMPLE ADVECTION-DIFFUSION MODEL,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
P. L. Richardson, and K. Mooney.
Journal of Physical Oceanography, Vol 5, No 3, p 476-482, July 1975. 6 fig, 17 ref. ONR N00014-68-A-0215-0003, N00014-74-C-0262 (NR083-004).

Descriptors: *Ocean currents, *Salinity, *Advection, *Mixing, *Circulation, *Atlantic Ocean, Mathematical models, Velocity, Diffusion, Oceans, Distribution.
Identifiers: Peclet number, *Mediterranean water tongue, Salinity anomalies.

The influence of the subtropical gyre on the spread of Mediterranean water in the Atlantic was discussed in terms of a simple horizontal advection-diffusion model. The northern, southern, and western boundaries of a rectangular ocean were treated as salt sinks while the distribution of salinity on the east coast representing the highly saline Mediterranean water was represented as a sine curve. The velocity distribution for the subtropical gyre was that given by Stommel and included westward intensification. Salinity distributions were calculated for various values for the Peclet number, and for oceanographically reasonable values they indicated that the gyre passed through the high-salinity tongue and advected it toward the south and west. The model was consistent with the observed salinity distribution of the mid-layers of the North Atlantic. (Adams-ISWS)

THE THEORY OF WAVE PROPAGATION IN WATER OF GRADUALLY VARING DEPTH AND THE PREDICTION OF BREAKER TYPE AND HEIGHT,
Oregon State Univ., Corvallis. School of Oceanography.
M. K. Gaughan, and P. D. Komar.
Journal of Geophysical Research, Vol 80, No 21, p 2991-2996, July 20, 1975. 9 fig, 8 ref.

Descriptors: *Ocean waves, *Waves(Water), *Beaches, Analysis, Theoretical analysis, Coastal engineering, Hydrodynamics, Height, Depth, Wavelengths, Profiles, Coasts.
Identifiers: *Breaking waves, *Wave steepness, Breaking depth.

Biesel's theory of wave propagation in water of gradually varying depth was applied to determine the dependence of breaker type (plunging or spilling) on beach slope and on deep water wave steepness, the ratio of the wave height to the wave length. With the fluid motion at the surface represented in Lagrangian coordinates, a graph was developed for the breaker type on the basis of 21 combinations of beach slope and deep water wave steepness. Comparison with laboratory wave tank data on breaker types showed good agreement with the theoretically-based graph. The steepening of the shoaling wave profile on the shoreward wave face resulted in the occurrence of a vertical surface. The first appearance of such a vertical surface provided a natural breaking criterion compatible with experimental usage. Using this breaking criterion, the ratios of breaking wave height to deep water wave height to depth at the breaking point were theoretically evaluated. The dependence of the ratio of breaking weave height to deep water wave height on the deep water wave steepness was correctly demonstrated by the theory. (Adams-ISWS)

EDGE WAVES AND BEACH CUSPS,
Scripps Institution of Oceanography, La Jolla, Calif.
R. T. Guza, and D. L. Inman.
Journal of Geophysics Research, Vol 80, No 21, p 2997-3012, July 20, 1975. 10 fig, 2 tab, 54 ref. NOAA USDC 2-35208.

Descriptors: *Waves(Water), *Beach erosion, *Resonance, *Coasts, Shores, Ocean waves, Beaches, Laboratory tests, Analysis, Geomorphology, Theoretical analysis, On-site data collections.
Identifiers: *Edge waves, *Beach cusps, *Wave reflection.

The spacings of some beach cusps formed under reflective wave conditions both in the laboratory and in certain natural situations were shown to be consistent with models hypothesizing formation by: (1) subharmonic edge waves (period twice that of incident waves) of zero mode number, or (2) synchronous edge waves (period equal to that of incident waves) of low mode. Laboratory experiments showed that visible subharmonic edge wave generation occurred on nonerodable plane beaches only when incident waves were strongly reflected at the beach. Edge wave resonance theory and experiments suggested that synchronous potential edge wave generation could occur on reflec beaches and would have a higher-order, we resonance than the subharmonic type. In dis tive systems, modes of longshore periodic mo other than potential edge waves have been fo to be important. On reflective plane labora beaches, initially large subharmonic edge w rearranged sand tracers into shapes resemb natural beach cusps, but the edge wave amplit decreased as the cusps grew. Cusp growth limited by negative feedback from the cusps t edge wave excitation process. Small edge w formed longshore periodic morphologies providing destablizing perturbations on a b located in the swash zone. In this case, the ret ing incident wave surge was channelized breeches in the berm caused by the edge wa and initial feedback from the topography t longshore periodic perturbations was pos (Adams-ISWS)

SALT WATER INTRUSION INTO POR MEDIA,
S. V. Regional Coll. of Engineering and Techn gy, Surat (India)
R. N. Shelat, P. R. Mehta, and G. G. Patel.
Journal of the Institution of Engineers (India), 55, Part PH 2, p 55-60, February, 1975. 8 fig, 7

Descriptors: *Model studies, *Saline wate trustion, Encroachment, *Aquifers, Interfa Recharge, Saline water-freshwater interfa Subsurface waters, Hydrology, *Porous m Groundwater.

Experimental model studies were performed t vestigate some aspects of subsurface salt wat trusion. The problem of salt water intrustion coastal aquifers is essentially a problem stratified fluid flow in porous strata. A boun surface or interface is formed wherever the fluids (freshwater and seawater) are in con The experimental apparatus comprised a H shaw model, pumping arrangement, and trolling devices. The model consisted of pieces of 12 mm thick plate glass spaced ab mm apart and connected to a reservoir consi of 20 cm x 20 cm x 70 cm high perspex she either end. A well defined interface bet lighter and heavier fluids was shown and Ghyben-Herzberg relationship was satisfie type of mixing distinct from diffusion occurr the interface whenever the interface shifted. wedge front velocity was determined to be i sely proportional to wedge length and also de dent upon the inclination of impervious bed density of the intruding fluid. The fresh w piezometric surface must be above the mea level a distance equal to S minus one time distance below sea level to the lowest pum zone which must be protected in order to pre sea water intrusion into coastal aquifer, where the specific gravity of sea water. For an aquif finite thickness, the maintenance of fresh w surface above sea level will result in seaward of fresh water. The relationship between equilibrium wedge length and the rate of sea flow of fresh water is independent of the dist of the aquifer below sea level. Correction in draft conditions by suitable recharge is a fea method to check the intrusion. (Orr-FIRL)

VOLUMETRIC CHANGES IN BEACH PROFILES,
Glamorgan Polytechnic, Pontypridd(Wales).
A. T. Williams.
Shore and Beach, Vol. 42, No. 2, p 23-28, October 1974. 8 fig, 7 ref.

Descriptors: *Beaches, *Erosion, *Waves(Water), *Bays, *Winds, *Typhoons, Tides, Cyclones, Deposition(Sediments), Wind tides, Currents(Water), Asia.
Identifiers: *Longshore current, *Accretional changes, *Hong Kong Island, Swells.

Three beaches located on Hong Kong Island were investigated with regard to monthly changes in beach profiles. At each of the beaches two profiles were measured. The study was concerned with accretional and erosional changes that took place between successive survey periods. For one of the beaches, the maximum vertical profile changes recorded were nearly one meter. During the 1970 and 1971 surveying seasons the bulk of the tropical cyclones affecting Hong Kong generated low swells, and these rather than the influence of onshore and offshore winds during the summer appeared to be the dominant influence on beach changes. Sediment removal by large typhoonal wave attack was rapid, but in the study period little beach sediment was removed. The changes recorded confirmed impressions of seasonal reversals of beach processes. The beaches were in a state of dynamic equilibrium so that fears of permanent sediment removal were probably groundless. (Bhowmik-ISWS)

MODE TIDES,
California Univ., San Diego, La Jolla. Inst. of Geophysics and Planetary Physics.
B. Zetler, W. Munk, H. Mofjeld, W. Brown, and F. Dormer.
Journal of Physical Oceanography, Vol. 5, No. 3, p 430-441, July 1975. 2 fig, 4 tab, 15 ref, 1 append. ONR N00014-69-A-0200-6008, NSF GX-29052.

Descriptors: *Tides, *Atlantic Ocean, *Ocean currents, Measurement, Analysis, Analytical techniques, Diurnal, Currents(Water), Oceanography.
Identifiers: *MODE, Bottom pressures, Deep-sea tides, Gravitational tides, Radiational tides, Tidal currents.

Bottom pressure measurements at four MODE stations constitute a unique set of deepsea tidal measurements. A response analysis relative to a Bermuda reference has been optimized with regard to the number of complex weights and the makeup of gravitational and radiational inputs. Duplicate instrumentation on EDIE capsule gave 32.067, 2.5 degrees; 32.074, 2.6 degrees for M sub 2 amplitude (cm) and Greenwich epoch, thus attesting the reality of measured small station differences (order 1 cm, 1 degree). M sub 2 tidal currents (calculated from the M sub 2 surface and bottom slopes) have u and v speeds of 0.5 and 0.8 cm/s, respectively, in rough agreement (both amplitude and phase) with preliminary estimates from current measurements. M sub 2 and K sub 1 tides are in accord with some existing cotidal and corange charts. M sub 3 tides are a fraction of equilibrium magnitude, whereas M sub 4, M sub 5, and M sub 6 (typically 0.07, 0.05, 0.03 cm) vastly esceed equilibrium values. Presumably these overtides are generated by nonlinear coupling in the world's shallow basins, from where they radiate into the global oceans to attain a level where radiative and dissipative processes are somehow balanced. Identifiers: *Ekman pumping, Trade winds, Volume transports.

Geostrophic transports in the upper 300 m relative to 1000 db were computed from observations along four meridional sections occupied monthly during the Trade Wind Zone Oceanography Study, February 1964 to June 1965. Transports varied from a minimum of about 11,000,000, cu m/s in February of both 1964 and 1965 to a maximum of 23,000,000 cu m/s in September 1964. The ridge in the thermocline at the southern edge of the current rose or fell simultaneously as the transport increased or decreased. Theoretical vertical dis-

LIBRARY U. OF I. URBANA-CHAMPAIGN

placements were computed from the wind stress curl. The observed vertical displacements of the thermocline were similar to the computed displacements. Thus, the observations of the Trade Wind Zone Oceanography Study are in agreement with a simple model of variation in the strength of equatorial currents. According to the model, the divergence of Ekman transports causes variation in the meridional slope of the thermocline and in the geostrophic current speed. (Sims - ISWS)

(COUNCIL ON EDUCATION IN THE GEOLOGICAL SCIENCES) PROGRAMS PUBLICATIONS, NO 18, ESTUARINE OCEANOGRAPHY,
F. F. Wright.
Mc-Graw Hill, New York, NY, 1974, 76 p, Illus, Maps.

Descriptors: *Estuarine environment, Oceanography, Limnology, Education.

Techniques for studying estuarine oceanography are outlined in this publication which is designed as a laboratory supplement for undergraduate courses in oceanography or limnology. The estuarine environment is discussed, e.g., geomorphology, geology, biology and oceanography. The techniques to be employed are then described. These methods include: study-site selection; working boats; bathymetric survey; tides and tidal observations; wave determination and analysis; current measure; water sampling and analysis and tracer and diffusion studies. Mixing and flushing in estuaries is also considered. An exercise on a model estuary, Hypothetical Bay, is included with study plans. Appendices provide additional information on the use of commercial equipment for classroom studies, current drogue specifications, bathymetric survey dats sheets, current measurement sheets, drift-can data and inshore T-S 9temperature-salinity) probe survey sheets. Numerous graphs and illustrations supplement the test.--Copyright 1974, Biological Abstracts, Inc.

DESALTERS SOW SEEDS FOR SAUDI INDUSTRY.
Chemical Week, Vol 117, No 7, p 57-58, August 13, 1975

Descriptors: *Desalination, *Treatment facilities, Design, Powerplants, Sea water, Electrical engineering, Waste water treatment, Water treatment.
Identifiers: *Saudi Arabia.

Three dual-purpose desalination and electric generating plants have been planned for Saudi Arabia. A 50 mgd, 500-mw plant in Jedda on the Red Sea is being designed by a British firm, while two plants in the Eastern province, a 30 mgd, 300-mw plant at Al-Jobail and a 5 mgd, 50-mw plant at Al-Khafji, are being designed by a United States corporation. A conventional desalination method of multistage flash evaporation will be employed. While this technique requires a large amount of steam to make fresh water, the hydrocarbons necessary for producing steam are plentiful in Saudi Arabia and the need for water is crucial. By integrating the desalting plants with the production of electrical power, the fresh water production costs will be only 12 cents per cu m. The actual engineering, designing, and construction of the three plants will cost $15 billion and contracts will be divided into packages for bidding. Among these packages are: a power plant, including the steam boiler, site preparation, intake and outfall for the plant; living quarters for workers building the plant; and outside facilities such as power transmission. Additionally, Saudi Arabia has provided $3.5 million to organize a research center to study seawater desalination and related problems such as corrosion. (Kramer-FIRL)

THE EFFECT OF FINITE CHANNEL WIDTH ON CONCENTRATION POLARISATION REVERSE OSMOSIS UNDER LAMINAR FLOW CONDITIONS,
Birmingham Univ. (England). Dept. of Chemical Engineering.
J. W. Carter, and G. Hoyland.
Chemical Engineering Science, Vol 30, No 9, p 1190-1191, September, 1975. 4 fig, 1 tab, 9 ref.

Descriptors: *Membrane processes, *Reverse osmosis, Laboratory tests, Mathematical models, Separation techniques, Semipermeable membranes, Laminar flow, Membranes, Liquid wastes, Desalination processes, Waste water treatment.

In previously published theoretical treatments of reverse osmosis during laminar flow in channels of rectangular cross-section, the effect of the side walls on the local velocity gradient, and therefore on local concentration polarization, has been assumed to be negligible. The fact that this assumption does not hold true for narrow channels was theoretically investigated by considering the velocity distribution in the cross-section of a channel of finite width. Experimental investigations were conducted by making a membrane impermeable adjacent to the side walls. The effect o side walls on the velocity profile was theoret demonstrated to be largely confined to a widt jacent to them equal to the channel height sets of laminar flow reverse osmosis experi were conducted using sodium chloride solu Smooth clean semi permeable cellulose ac membranes were used in each case. The e mental and predicted concentration polarizat the membrane surface in each of the two s compartments was calculated. Masking is req for experimental results to conform with p tions based on an infinitely wide channel. FIRL)

WATER REPELLENT SOIL MULCH FOR REDUCING FERTILIZER NUTRIENT LEACHING: II. VARIABLES GOVERNING THE EFFECTIVENESS OF A SILICONATE SPRAY,
Agricultural Research and Education Center, Belle Glade, Fla.
G. H. Snyder, H. Y. Ozaki, and N. C. Hayslip.
Soil Science Society of America Proceedings, Vol 38, No 4, p 678-681, July-August, 1974. 4 tab, 7 ref.

Descriptors: *Mulching, *Nitrogen, *Potassium, *Leaching, *Nutrients, *Sweet corn, Crop production, Crop response.

Nitrogen and potassium leaching from a fertilizer band in sand soils was reduced by creating a mulch of water repellent soil over the band using a siliconate spray. Best results were obtained using a 1% siliconate spray in quantities sufficient to penetrate about 3 cm over a region 20 cm wide, on the flat surface of raised vegetable beds. Mulches created on peaked beds were ineffective in reducing leaching, probably due to erosion of the mulch. Sweet corn yields are comparable to those obtained by protecting N and K with plastic mulch or by applying N and K in split applications. (Skogerboe-Colorado State)

EFFECT OF SALTS AND SALTS PLUS NITROGEN-15-LABELED AMMONIUM CHLORIDE ON MINERALIZATION OF SOIL NITROGEN, NITRIFICATION, AND IMMOBILIZATION,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
R. L. Westerman, and T. C. Tucker.
Soil Science Society of America Proceedings, Vol 38, No 4, p 602-605, July-August, 1974. 1 fig, 5 tab, 11 ref.

Descriptors: *Nitrogen, *Nitrification, Salinity, *Salts, *Ammonium compound, Water pollution sources.
Identifiers: *Mineralization, Immobilization.

The effects of 0.0, 0.01, 0.1 and 1.0M concentrations of sodium, copper and calcium chloride salts added to Pima clay loam with and without (15) NH4C1 on mineralization of soil nitrogen, nitrification, and immobilization were measured over a 49-day period. Dilute concentrations of salt, (15) NH4C1, and dilute salts plus (15) NH4C1 stimulated mineralization of soil N. The 'priming effect' was shown to be real and not just a simple exchange. Nitrification of native ammonium nitrogen and (15) N-labeled ammonium decreased with increasing concentrations of salt. High concentrations of copper and calcium chloride salts inhibited nitrification of (15) N-labeled ammonium more than sodium salts. Immobilization of (15) NH4 (+) -N was decreased significantly by high concentrations of salt. Gaseous loss processes were decreased with increased salts. (Skogerboe-Colorado State)

INTERACTIVE EFFECTS OF SALINITY AND FERTILITY ON YIELDS OF GRAINS AND VEGETABLES,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
L. Bernstein, L. E. Francois, and R. A. Clark.
Agronomy Journal, Vol 66, No 3, p 412-421, May-June, 1974.

Descriptors: *Salt tolerance, Salinity, *Crop response, *Fertilization, Saline soils, Corn(Field), Wheat, Barley, Vegetable crops, Phosphates, Crop production.

The salt tolerance of crops has usually been studied under optimal fertility conditions. The objectives of the present studies were to compare crop response to salinity when nutrients were limiting, adequate, or in excess to guide proper fertilization of saline soils and to determine whether additional fertilizer could restore yield losses caused by salinity. Corn, wheat, barley, and six vegetable crops were grown to maturity in large, outdoor sand cultures to study the interactive effects of salinity and nutrition. Increasing levels of phosphate (0.1 to 2.0 mM) aggravated salt injury in corn and decreased salt tolerance. Decreasing solution K from 2 to 0.4 meq/liter did not affect leaf K or yield of corn. Deficient levels of P or N did not consistently decrease salt tolerance of any of the crops studied, although the wheat and barley varieties showed erratic decreases in salt tolerance when N or P were deficient. When N or P was severely growth-limiting, salinity affected growth of some crops. Conversely, when salinity severely limited growth, nutritional responses of some crops decreased. POTENTIAL FOR AGRICULTURE UTILIZING WASTE HEAT FROM POWER PLANTS,
Arizona Univ., Tucson. Environmental Research Lab.
N. G. Hicks.
In: Conference on Water Requirements for Lower Colorado River Basin Energy Needs, May 8-9, 1975, p 231-240.

Descriptors: *Water requirements, *Water utilization, *Thermal pollution, *Environmental engineering, *Greenhouses, Arizona, Water supply, Economics, Water resources, Arid lands, Water conservation, *Energy, Heat, Temperature, Plant growth, Heated water, Heating, Power plants, Horticulture, Soil temperature, Agriculture, Profit, Nutrients, Industrial plants.
Identifiers: Soil warming.

The quality of heat (temperature level) is more appropriate to the biological processes of plant and animal grwoth than it is to almost any kind of industrial or process application. Research effort has been centered on soil warming, mariculture or aquaculture, and greenhouse vegetation production. Open field agriculture crops consume from 1.5 to 6 acre feet per year of water, and yield from 100 to, at most, 400 dollars per acre in gross revenue. Controlled-environment agriculture consumes about 7 acre feet of irrigation and cooling water per year, with a gross revenue of from 60,000 to 180,000 dollars per year, and with a 95% recovery of applied nutrients by the plants. The amount of heat rejected from a southern Arizona copper smelter is more than adequate to handle the types of greenhouse facilities being conceived today, and the energy level of the heat from these

LIBRARY U. OF I. URBANA-CHAMPAIGN

smelters has a thermodynamic availability such that conventional heating methods can be employed within the greenhouse. (See also W76-00745) (Robinett-Arizona)

ACCRETION AND DILUTION OF NUTRIENTS IN YOUNG CORN, AS AFFECTED BY YIELD RESPONSE TO NITROGEN, PHOSPHORUS, AND POTASSIUM,
National Fertilizer Development Center, Muscle, Ala.
G. L. Terman, and S. E. Allen.
Soil Science Society of America Proceedings, Vol 38, No 3, p 455-460, May-June 1974. 5 fig, 1 tab, 13 ref.

Descriptors: Fertilizers, Nutrient removal, Nutrients, *Nitrogen, *Phosphorus, *Potassium, *Corn(Field), *Crop response.

Hybrid corn was grown in infertile soil fertilized with none and three nonzero rates of N, P, or K in separate treatment series; other nutrients were applied in each series at uniform levels. Near-linear increases in uptake of N, P, or K with amount applied occurred during 25, 41, and 53 days' growth. Concentrations of N, P, or K increased with amount applied and decreased with continued growth in each series; uniformly applied P and K, N and K, or N and P were diluted with increase in dry matter resulting from continued growth and yield response to increasing amounts of the third nutrient. Yield-concentration relationships in the N response series were similar for N, Ca, Mg, Mn, and Zn. Response to P or K resulted in dilution of all other nutrients. Concentrations of total cations increased with concentrations of N in each response series; the reverse was true with P and K. Thus, the results suggest that a positive relationship between dry matter yields and total cations (C), total inorganic anions (A), and C-A depends on whether yield reponse is due to N or to other growth-limiting factors. Five rates of Ca(OH)2 and four rates of Ca(H2PO4)2-H2O were added in all combinations to samples of a P-deficient, low pH, sandy loam soil. The treated soil was subjected to several wetting-drying-pulverizing cycles to facilitate equilibration. Soil solutions were subsequently displaced from sub-samples and analyzed; other subsamples were extracted for P and CaCl2 and dilute acid; 'labile P' was determined on subsamples from each treatment; a sorghum-sudangrass hybrid was grown in the greenhouse to measure P availability. Maximum yield of test plants was obtained at about 22 micro-m of P in the displaced soil solution, 12 micro-m of P in the CaCl2 extract, 80 ppm P on soil-weight basis in dilute-acid extract, and 50 ppm of 'labile P' on soil-weight basis. The P uptake was highly correlated with the logarithm of P concentration in soil solution and CaCl2 extract, logarithm of 'labile P' and concentration of P in dilute acid extract. All indexes were nearly equal as indicators of P availability. (Skogerboe-Colorado State)

A TWO-PHASE MODEL FOR THE MISCIBLE DISPLACEMENT OF REACTIVE SOLUTES IN SOILS,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
J. Skopp, and A. W. Warrick
Soil Science Society of America Proceedings, Vol 38, No 4, p 545-550, July-August, 1974. 5 fig, 1 tab, 32 ref. EPA Contract 68-03-0208

Descriptors: *Model studies, Solutes, Adsorption, Diffusion, Connection, Soils, Calcium, Magnesium, Water quality.
Identifiers: *Miscible displacement, Solute transfer, Picloram.

Miscible displacement is studied by considering the flow regime to be composed of separate mobile and stationary phases. Solute transfer through the mobile phase occurs only by convection, whereas adsorption or reaction by the soil matrix is diffusion limited and occurs normal to the mobile-stationary interface. The model is unique in that a specific rate law is not assumed, but the solution is exact. Results are presented graphically as a function of two parameters which are compared with experimental results of other workers. The displacement of calcium by magnesium was more closely in agreement with theoretical predictions than was absorption of picloram. (Skogerboe-Colorado State)

Descriptors: *Saline soils, Salinity, Ions, *Transpiration, Salts, *Corn(Field), *Root zone.
Identifiers: Ion accumulation, Closely adhering soil, Loosely adhering soil.

Laboratory studies were conducted to determine the extent of ion accumulation around corn roots of plants exposed to different transpiration conditions. Ion accumulation in the apparent free space of roots, the soil adhering to the roots, and the bulk soil was studied using a soil mixed with sodium chloride so that the electrical conductivity of saturation extract was 3.96 mmho/cm. Maximum ion accumulation occurred in the apparent free space of the roots, followed by the closely adhering soil. Under high transpiration, sodium concentration increased from 37.6 mg/100 g in the bulk soil to 90.3 mg/100 g in the soil close to the roots. After the same treatment, a threefold increase in the chloride content of the closely adhering soil was observed. A significant correlation existed between the rate of water loss per unit root length and the Na and Cl concentration of the closely adhering soil. Results indicate that under high transpiration, the salt concentration close to the roots may be much higher than that obtained from an analysis of the bulk soil. (Skogerboe-Colorado State)

MINIMIZING THE SALT BURDENS OF IRRIGATION DRAINAGE WATERS,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
J. D. Rhoades, J. D. Oster, R. D. Ingvalson, J. M. Tucker and M. Clark
Journal of Environmental Quality, Vol 3, No 4, p 311-316, October-December, 1974. 7 tab, 7 ref.

Descriptors: *Salinity, *Saline water, *Drainage, *Drainage water, Lysimeter, Return flow, Water quality, Water pollution, Alfalfa, *Saline soils, Irrigation, Irrigation practices.

The salt burdens of percolated drainage waters resulting from the use of water, synthesized to represent eight important river waters of the western USA, for irrigation of alfalfa in a controlled lysimeter experiment, are presented. These data show that minimizing the quantity of drainage water resulted in the smallest possible return of applied salts in the return flow because (1) it maximizes the precipitation of carbonate minerals and gypsum in the soil, (2) it minimizes soil mineral weathering and the dissolution of salts previously deposited in the soil, and (3) it maximizes the amount of soluble salt diverted in the water that is retained in storage in the soil profile and not returned in the drainage water. ASSESSING SOIL SALINITY AND IDENTIFYING POTENTIAL SALINE-SEEP AREAS WITH FIELD SOIL RESISTANCE MEASUREMENTS,
Agricultural Research Service, Sidney, Mont.
A. D. Halvorson, and J. D. Rhoades.
Soil Science Society of America Proceedings, Vol 38, No 4, p 576-581, July-August 1974. 7 fig, 4 tab, 12 ref.

Descriptors: *Salinity, *Soil tests, Soil properties, Electrical conductance, Measurement, Instrumentation, Great Plains, *Saline soils.
Identifiers: Soil conductivity.

The recent widespread increase in the occurrence of seep areas high in salinity in the northern Great Plains has increased the need for soil salinity research. The objective of the study was to examine the use of soil conductivity values calculated from resistance measurements obtained with the four-probe-Wenner electrode configuration to identify potential saline-seep areas and estimate soil salinity in the field. Plots of apparent soil conductivity (EC) vs inner-electrode spacing (a) yielded different types of curves for saline-seep areas, recharge areas, and intermediate areas. Plots of EC vs a or EC values alone can be used to identify potential saline-seep areas. Significant correlations were obtained in May (r=0.98) and August (r=0.96) between apparent soil conductivity and electrical conductivity of saturation extracts showing that four-probe soil resistance measurements can also be used to estimate soil salinity in the field. NSHIP'S NEED OF FILTERED WATER,
n and Steel Co., Ltd, Jamshedpur (India).
ngineering Dept.
osh.
of the Institution of Engineers (India), Vol PH 2, p 40-42, February, 1975. 5 tab, 3 ref.

ors: *Water demand, *Water supply, utilization, Water users, Water require-Domestic water, Industrial water.

In order to determine the future water requirements of the twonship of Jamshedpur, India, the consumption of water was divided into different consuming divisions: domestic; public and municipal; commercial; industrial; and, miscellaneous and wastage. Tables are presented which illustrate the total daily consumption, both past and present, for each of these categories. The figures have been used to project future consumption figures, on the basis of expected development of each of these five categories. The township may require an average supply of 138 million liters/day of filtered water in 1986, with an expected increase over the following ten years to 157 million liters/day. The consumption rate for the population may reach 452 lped by 1986, and 476 by about 1996. Domestic consumption equalled about 75% of the total consumption in 1951, 60% of the total in 1971, and will most likely equal 53% of the total in 1996. In the future more filtered water will be used for industrial, commercial, public and municipal activities and less will be used for domestic purposes. The present growth rate of the curve for miscellaneous use and wastage must be restricted to limit the potential wastage of filtered water. (Orr-FIRL)

ENERGY QUALITY INTERACTIONS OF SUNLIGHT, WATER, FOSSIL FUEL, AND LAND,
Florida Univ., Gainesville, Dept. of Environmental Engineering Sciences.
H. T. Odum.
In: Conference on Water Requirements for Lower Colorado River Basin Energy Needs, May 8-9, 1975, p 165-194. 16 fig, 1 tab, 4 ref.

Descriptors: *Energy, *Energy conversion, *Solar radiation, *Water utilization, Energy transfer, Energy loss, Energy dissipation, Fossil fuels, Water properties, Economics, Efficiencies, Water resources, Arid lands, Arizona, Water shortage, *Desalination, Heated water, Vegetation effects, Electric power production.
Identifiers: Energy flows, Amplifier actions, *Solar energy.

To maximize power, energy flows generate energy of higher quality and a chain of energy quality transformations develops with total calories of energy decreasing at each step but with increasing quality and concentration of that transformed. High quality energy, such as fossil fuel, realizes its value only when it is used to amplify another energy flow of lower quality with as much stimulation of new energy flow as was used in its formation. The energy qualities of a Calorie of sunlight, fossil fuel, and water estimated from the energy used in transformations are summarized. Energy relationships of desalination, solar energy conversion to electricity, solar energy use by productivity compared with solar technology, solar water heaters, and dispersed solar heat are discussed along with choices in use of energy and water in arid regions. ENVIRONMENTAL ASPECTS OF SOLAR ENERGY APPLICATIONS,
Arizona Univ., Tucson. Opitical Sciences Center.
A. B. Meinel, and M. P. Meinel.
In: Conference on Water Requirements for Lower Colorado River Basin Energy Needs, May 8-9, 1975, p 196-205.

Descriptors: *Energy, *Energy conversion, *Solar radiation, *Water utilization, *Powerplants, Efficiencies, Arizona, Water resources, Arid lands, Heated water, Electric power production, Heat transfer, Agriculture, Planning, Water conservation, Heating, Cooling.
Identifiers: *Solar energy, Solar power farms, Solar energy conversion.

The future of solar energy is described. Arizona could grow enough alfalfa to operate its power plants at a reasonable cost, but it would take most of the total flow of the Colorado River to support the irrigation load. Conversion of solar energy into heat and then using this heat for constructive purposes such as heating water for domestic and commercial applications appears to be a possible option. House heating and cooling is technologically a simple task in comparison with generating electrical power. The subject of large solar farms which would collect energy for whole communities is discussed along with the possibility of an extensive farm of solar collectors as the heat rejection system of conventional power plants. Assuming a conversion efficiency of 25%, it would require 10,000 square miles of solar farms to generate enough energy to meet the current national need. (See also W76-00745) (Robinett-Arizona)

WATER CONSUMPTION AND POWER PLANT HEAT REJECTION,
Arizona Univ., Tucson. Dept. of Nuclear Engineering.
R. Fazzolare.
In: Conference on Water Requirements for Lower Colorado River Basin Energy Needs, May 8-9, 1975, p 241-257. 6 fig, 2 tab, 3 ref.

Descriptors: *Water requirements, *Water supply, *Water demand, *Electric power industry, *Water conservation, *Nuclear power plants, Water management(Applied), Economics, Water utilization, Water resources, Arid lands, Water sources, *Arizona, Electric power production, Planning, Energy, Cooling water, Recirculated water, Heat transfer, Ventilation, Costs, Efficiencies, Water cooling, Nuclear reactors, Cooling towers, Heated water, Fossil fuels.

Water requirements and consumption in thermal electric power plants in which fossil fuels and uranium are used as the primary energy source are discussed. 50% of the heat rejection from power plants in the U.S. is of the once-through type and the other 50% is accomplished by means of cooling towers in which air passes over sprayed water and induces the evaporative cooling. For a large community, it is estimated that the waste waters produced are about 4 times the cooling requirement of a nuclear power plant that could generate the electrical needs of the community. Average cooling water evaporation for fossil fuel power generation in Arizona of a 1000 megawatt plant was 11,700 acre-feet per year and for nuclear plants from 15,000 to 19,000 acre-feet per year. Comparisons of dry and wet cooling schemes show capital costs of dry cooling systems to be 4 times that of wet towers. (See also W76-00745) (Robinett-Arizona)

THERMAL POWER PLANT SITING IN AN ARID REGION-ENVIRONMENTAL CONSTRAINTS,
Bechtal Power Corp., Los Angeles, Calif.
H. Ponrehn.
In: Conference on Water Requirements for Lower Colorado River Basin Energy Needs, May 8-9, 1975, p 258-303. 3 fig, 3 ref.

Descriptors: *Water conservation, *Water requirements, *Water supply, *Thermal powerplants, *Arid lands, *Environmental effects, Electric power industry, Economics, Water utilization, Water resources, Electric power production, Sites, Planning, Energy, Water consumption(Except Consumptive use), Locating, Ecology, Environmental engineering, Air pollution, Public health, Safety, Design criteria, Evaluation, Geology, Topography, Meteorological data, Esthetics.
Identifiers: Environmental constraints, Powerplant site selection.

There are a number of concerns in the arid region siting of thermal power plants; primary concern is the consumption of water. Additional concerns are esthetics and environmental constraints imposed on the site selection by public pressures, from regulatory agencies at all levels of government, from the engineering features of the project, and from economic pressures and scheduling constraints. Careful consideration of plant, transmission line, and access route layout and design can minimize impacts on highly sensitive and slowly recovering ecosystems which characterize arid regions. The geological and seismological characteristics of a region are of highest priority in assessing its acceptability for siting a nuclear plant, whereas fossil plant site selection, due to the concern for air quality impacts, is influenced strongly by the meteorological and topographic features of an area. Coal fired power plant site selection is severely constrained by the location of the fuel source and the economics of fuel transportation. (See also W76-00745) (Robinett-Arizona)

omy Journal, Vol 66, No 4, p 584-588, July-
st, 1974. 5 fig, 11 ref.

Descriptors: *Root development, *Root systems, Crop response, Moisture tension, *Moisture availability, Soil-water-plant relationships, *Cotton, Soil water.

Many experiments have evaluated the effects of decreasing soil water contents on top growth and yield of plants, but few experiments simultaneously have evaluated root growth. An experiment was conducted to determine the response of cotton roots and tops to decreasing soil water content. Plants were grown in rhizotron compartments with rainfall excluded by metal covers over the soil. Soil profile or irrigation schedule treatments provided different levels of soil and plant water potentials. Soil water content was determined with a neutron probe; rooting density, from measurements of roots on the glass viewing surface of each compartment. Plant water potential was determined with a pressure chamber apparatus, and top growth was evaluated by plant height. For conditions of this experiment, cotton root growth was correlated with decreases both in plant water potential and in soil water content. (Skogerboe-Colorado State)

MIXING IN SPRINKLER IRRIGATION SYSTEMS,
CH2M/Hill, Redding, Calif.
G. J. Hermann, G. M. McMaster, and D. W. Fitzsimmons.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 17, No 6, p 1020-1024, 1028, November-December, 1974. 6 fig, 9 ref.

Descriptors: *Sprinkler irrigation, *Irrigation practices, Irrigation, *Mixing, Irrigation water, Fertilization, Fertilizers, *Idaho, Flow.
Identifiers: Branching flow mixing.

A study was conducted at Aberdeen, Idaho, to determine the amount of mixing between two fluids traveling in a branching flow lateral under the field conditions found in a sprinkler irrigation system. The objective was to develop methods to predict the effects of state of flow, of couplers and of branching flow on mixing and dilution of chemical injected into operating sprinkler irrigation laterals. The resulting basic understanding of branching flow mixing could be used to manage chemical applications through sprinkler systems for best placement and effectiveness. Using irrigation systems to apply chemicals will reduce the usage of conventional application equipment and result in labor and energy savings as well as a reduction of soil compaction and crop damage. (Skogerboe-Colorado State)

Descriptors: *Water management, *Drainage, *Corn(Field), *Sugarbeets, *Alfalfa, Irrigation effects, Irrigation practices, Drainage practices, *Crop production.

The objective in this field study was to determine the most desirable combination of amount of irrigation and degree of drainage for production of corn, sugarbeets, and alfalfa grown on sandy soil over a declining water table. Irrigation was applied at weekly intervals at rates of either 0, 0.5, 1.0, or 1.5 times the water requirement of the crops as predicted by the modified Jensen-Haise equation. Irrigation amounts were applied in combination with shallow, medium, and deep drainage. In 1971 and 1972, early season depth to water table was 92 and 69 cm for the shallow drainage treatment, 166 and 145 cm for the medium, and 186 and 193 cm for the deep. Water-table declines were 94 and 96 cm during the 1971 and 1972 growing seasons, respectively, under all treatments. Corn was harvested at maturity, sugarbeets in mid-October, and alfalfa (three cuttings) at 1/10 bloom. Maximum yields of all crops occurred over the shallow water table; no yield response to irrigation was observed over the shallow water table. (Skogerboe-Colorado State)

Identifiers: *Yakima River Basin(Wash), MACRO models.

Simple simulation (MACRO) models that contain a few parameters and that provide a gross representation of a river basin in space and time have the advantages of rapid construction and a transparent development process. These attributes are valuable when synthesizing and examining major linkages between more detailed models of various sectors of a river basin. The construction, theory, and application of MACRO models to integrate and evaluate the system analysis of the Yakima River Basin in presented and their utility demonstrated. (Bechard-Washington)

OPTIMAL SIZING OF URBAN FLOOD-CONTROL SYSTEMS,
Hydrologic Engineering Center, Davis, Calif. Planning Analysis Branch.
D. W. Davis.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY8, Paper 11490, p 1077-1092, August 1975. 5 fig, 1 tab, 9 ref, 2 append.

Descriptors: *Computer models, *Simulation analysis, *Systems analysis, *Flood control, *Optimization, Urban hydrology, Hydrology, Hydraulics, Flood protection, Mathematical models, Cost analysis, Planning.
Identifiers: Economic feasibility.

Optimal sizes for components of urban flood-control systems can be determined from a detailed simulation analysis controlled by an optimization methodology. Flood-control measures within urban areas frequently consist of complex systems of detention storage reservoirs, channel modifications, levees, land-use controls, flood proofing, and pumping facilities. The optimal size of each of these system components depends on the system interaction with other components and the hydrologic, economic, environmental, and other performance outputs of the system. A technique has been developed and programmed for an existing model that automatically determines the sizes of urban flood-control components of detention storage, flow diversions, and pumping plants to maximize system net benefits. The system was simulated using hydrologic data, component cost and performance functions, and flow damage information at damage centers. (Terstriep-ISWS)

FLOOD-HAZARD STUDY--100-YEAR FLOOD STAGE FOR APPLE VALLEY DRY LAKE, SAN BERNARDINO COUNTY, CALIFORNAI,
Geological Survey, Menlo Park, Calif.
M. W. Busby.
Available from the National Technical Information Service, Springfield Va. 22161. Water-Resources Investigations 11-75, June 1975. 40 p, 16 fig, 7 tab, 10 ref, 2 append.

Descriptors: *Flood plain zoning, *Flood frequency, *Deserts, *Californai, Playas, Land use, Construction, Flood protection, Flood forecasting, Peak discharge, Hydologic data, Synthetic hydrology.
Identifiers: *San Bernardino County(Calif), *Apple Vallye(Calif).

The 100-year flood stage for Apple Valley dry lake in Sa. Bernardino County, Calif., was developed by synthetic hydrologic techniques because adequate hydrologic or meteorologic data were not available for the basin. The 100-year flood stage was estimated to be at an elevation of 2,909.0 feet (886.7 metres) above mean sea level. Accelerated land developments during the past 10 years in the deserts of southern California may cause problems related to urban zoning. Much of the development consists of second or vacation-type homes, but also includes many expensive permanent residences. Desert playas or dry lakes often seem to be desirable development areas because of their flat topography and consequent abundance of good building sites. Although normally dry, playas commonly contain water after large storms, and homes built in and near the bottom of the playas can be subject to flooding. Because of this flooding potential, San Bernardino County is establishing flood-zoned areas on many playas. The boundary of the flood zone is defined by the 100-year water level--the water level that is exceeded, on the average, once in a 100-year period. (Woodard-USGS)

nd Wasserfach, Wasser/Abwasser, Vol 113,
p 430-435, September, 1972. 13 fig, 30 ref.

ptors: *Sewerage, *Runoff forecasting,
ematical models, Surface runoff, Urban
ogy, Parametric hydrology, Model studies.
iers: Germany.

-linear mathematical model of the urban sur-
unoff for the calculation of non-stationary
in sewer systems is presented. The calcula-
are based on general, simultaneous dif-
al equations for the surface runoff, i.e. the
uity and the energy equations. The latter can
uced to an equation for the resistance for
ary, uniform runoff which means that the
e runoff for a given interval can be regarded
sistationary and locally uniform. The com-
watershed is decomposed into surface ele-
with different successions of the runoff
caused by them. The specific runoff ob-
for the individual surface elements is then
osed to the corresponding surface elements.
put data of the mathematical model are
trical and hydrological parameters such as
g conditions, depth and distribution of sur-
epressions, surface roughness as well as
g and evaporation characteristics, propor-
and average length and slope of the in-
al surface element types. Results indicate that variations in rainfall intensity with time are of substantial influence on the magnitude of the runoff peak. (Sandoski-FIRL)

THE TOTAL RUNOFF COEFFICIENT IN MIXED SEWER SYSTEMS (DER GESAMTABFLUSSBEIWERT IN MISCHKANALISATIONEN),
K. Krauth.
Gas- und Wasserfach, Wasser/Abwasser, Vol 113, No 7, p 329-331, July, 1972. 7 fig, 2 tab, 3 ref.

Descriptors: *Storm runoff, *Runoff coefficient, Rainfall-runoff relationships, Sewerage, Soil water, Runoff forecasting.
Identifiers: Germany.

Results from measurements of the total runoff coefficient in the Stuttgart-Buesnau sewerage treatment facility indicates that the average quantity of storm water which fails to run off was found to be 0.52 mm (0.85 mm in dry weather and 0.46 mm in moist soil). This quantity of results almost exclusively from losses due to soil wetting and in the form of puddle water. After the total runoff coefficient is reduced accordingly with respect to this loss, it becomes a constant value of about 1. Therefore it is surmized that the average storm runoff for an individual rainfall can be calculated from the quantity of the precipitation, less the losses due to wetting and puddle water. (Sandoski-FIRL)

ON APPLYING THE PRINCIPLE OF MAXIMUM ENTROPY TO HYDROLOGICAL PROBLEMS AND RUNOFF FORECASTING (O PRIMENENII PRINTSIPA MAKSIMUMA ENTROPPI V ZADACHAKH GIRDOLOGII I PROGNOZIROVANIYA STOKA),
I. V. Busalayev, and S. K. Davletgaliyev.
Meteorologiya i Gidrologiya, No 4, p 61-68, 1972. 2 fig, 1 tab, 10 ref.

Descriptors: *Runoff forecasting, Distribution patterns, Hydrologic data.
Identifiers: Entropy, Experimental data.

A method for evaluating the probabilities of runoff magnitudes by applying the principle of maximum entropy is suggested. The selection of the most adequate distribution is possible by means of this principle which exploits experimental data available as much as possible without introducing any redundancy. In this study the principle is applied to two different problems: (1) the determination of the distribution with available data on the first three moments; and (2) the selection of the most adequate distribution with a multitude of curves for one and the same accidental magnitude. It is concluded that the principle of maximum entropy should be applied whenever a multitude of distributions are available without experimental data being sufficient or existent. (Sandoski-FIRL)

CHARACTERISTICS AND COUNTERMEASURES AGAINST URBAN RIVER FLOODS (TOSHI KASEN NO SUIGAI NO TOKUSEI TO TAISAKU),
H. Takahide.
Kankyo Joho Kagaku, Vol 1, No 1, p 33-37, May, 1972. 1 fig, 5 tab.

Descriptors: *Flood control, *Rivers, Cities, Rural areas, Flood damage, Population, Drainage, Sewerage, Storm runoff.
Identifiers: Japan.

A projected picture of flood control facilities and river conditions in urban areas for 1972 shows that 11.4% of the entire urbanized area in Japan will be endangered by floods at every rain of more than 50 mm hour quantity. According to the investigations of the Ministry of Construction, the percentages of flooded houses in urban and rural areas between 1961 and 1967 show a clear pattern. Except for 1962 when the number of total flooded houses was distributed evenly between the urban and rural areas, the majority of flood damage was found in the cities, the most prominent case being 80% to 20% in 1963. Between 1960 and 1970, the total space of congested city area in Japan increased by 65% with an increase in population of 15 million. This statistic translates to 53.5% of the total population of Japan living in an urban environment. As of 1971, the ratio of reinforced rivers in urban areas averaged 17%, and only 25% of the total urban area has flooded prevention measures. An estimated $48.8 million will be needed between 1974 and 1980 in order to remodel all the rivers, drainage, and sewage systems in Japan to accomodate storm runoff. (Sandoski-FIRL)

Identifiers: *Man's interference, *Stream constriction, Man-made modifications, Time trends, Maximum yearly stages, Minimum yearly stages.

The 1973 flood broke the stage (river level) records between Burlington, Iowa, and Cape Girardeau, Missouri, a distance of 562 km. At St. Louis, Missouri, the flood, which began March 10, continued for 77 consecutive days, exceeding the record set in 1844 when the river was in flood for 58 days during the entire year. The river crested at St. Louis on April 28, 1973 at a gage height of 13.18 m (4.03 m above flood stage) and a peak discharge of 24,100 cu m/sec. The stage topped the 189-year record by 0.3 m. The flood peak was 0.61 m higher in 1973 than in 1844 but the discharge was about 33% less than the estimated flow for 1844. The 1908 flood had the same flow as the 1973 flood but the peak was 2.51 m lower. The hydrographic data was analyzed to find out the reasons for record-breaking stages. The study concludes that the progressive constriction of the Mississippi for navigation since 1837 has caused bottom erosion in some stretches. In others, the bottom oscillates up and down with time. The high stages rise much more rapidly. Constriction of the river channel causes flooding and makes floods higher, thus navigation works degrade the protection afforded by levees. The combination of navigation works and levees causes significant rises in the stages of floods. Additional channel constriction and levee building will cause further problems. The 1973 flood's record was man-made. (Lee - ISWS)

PIERCE V. RILEY (ACTION BY RIPARIAN OWNERS FOR INJUNCTION TO PROVIDE ACCESS TO LAKE).
219 N. W. 2d 434 (Mich 1974).

Descriptors: *Riparian rights, *Canal construction, *Judicial decisions, *Michigan, Land tenure, Land resources, Canals, Bodies of water, Lakes, Water demand, Water resources development, Water law, Water management(Applied), Civil engineering.
Identifiers: *Injunctive relief.

An action was brought by riparian owners for a declaration of rights and injunctive relief against owners of a lot on which a canal had been constructed to provide access to the lake for ninety nonriparian lots. The lower court granted plaintiff's injunction but refused plaintiff's request to order the canal filled. On appeal the Supreme Court reversed, and held that the cause should be held in abeyance pending findings of fact and a decision by the Department of Natural Resources on an application by defendents pursuant to the Inland Lakes and Streams Act of 1972. (Proctor-Florida)

OMERNIK V. STATE OF WISCONSIN (APPEAL FROM CONVICTION FOR DIVERSION OF WATERS FROM LAKES AND STREAMS WITHOUT A PERMIT).
218 N. W. 2d 734 (Wis 1974).

Descriptors: *Wisconsin, *Alteration of flow, *Relative rights, *Diversion, Judicial decisions, Routing, Prior appropriateion, Riparian rights, Water management(Applied), Water utilization, Navigable waters, Streams, Lakes, Bodies of water, Water resources development, Water law, Legislation, Constitutional law.
Identifiers: Liability(Legal aspects).

By a judgment of the county court, the defendant was convicted of violations of a statute prohibiting the diversion of waters from lakes and streams without a permit. The Circuit Court affirmed. On appeal the Supreme Court of Wisconsin held that the statute applied to both navigable and non-navigable streams. The permit requirement set forth by the legislature was not limited to stream-to-stream diversion. The court further held that the statue did not deny the appellant equal protection of the law with respect to the categories of water use coverage and did not constitute the taking of property without just compensation. Identifiers: *England, *Pumping schemes, of estimate, Skewness.

Artificial changes in river flow, such as caused by groundwater abstraction, can sessed by means of flow regression equatio vided that adequate flow records exist a straction rates are sufficiently high. Experi in a number of group pumping tests has ind that the ratio of groundwater abstraction standard error of estimate of the equation u estimate artificial flow changes is critical to liability of the test results. This ratio should be considered in the design stage of tests to the meaningful results are obtained. (Vi ISWS)

D. H. Schaefer, and J. W. Warner.
Available from NTIS, Springfield, Va 2216 245-589 as price $3.75 printed copy; microfiche. Water-Resources Investigations July 1975. 27 p, 8 fig, 1 tab, 8 ref.

scriptors: *Artificial recharge, *Water spread- *Imported water, *Hydrogeology, lifornia, Aquifer characteristics, Groundwater vement, Infiltration rates, Forecasting, Water urces development, Water supply, Test wells, lling, Lithologic logs, Water yield, Water level tuations, Ground- water barriers, Ground- er potential, Faults(Geologic).
ntifiers: *San Bernardino County(Calif).

San Bernardino Valley, California Municipal ter District began receiving its initial entitle- nt of 46,000 acre-feet per year of imported thern California water in December 1972. By 0, the district will be receiving 102,000 acre- per year. Plans are to distribute this imported er for artificial recharge to the local ground- er system. The upper Santa Ana River area is l suited for artificial recharge because it is lar- underlain by permeable river-channel osits. Analyses of groundwater movement dur- current water-spreading operations, test- ling data, and application of Baumann's (1965) ation for calculating the theoretical size of the arge mound indicate that (1) barriers to undwater movement are not evident in the r-channel deposits, (2) depth to the basement plex is less in the area of the eastern spreading ins than in the western basins, (3) the spreading unds would be capable of accepting a combined l of as much as 80,000 acre-feet per year, and he water being recharged should move through part of the aquifer composed of river-channel osits toward the areas of pumpage. o Department of Natural Resources, Colum- Report of Investigations No 96, 1975. 14 p, 6 l tab, 5 ref.

criptors: *Groundwater resources, *Well data, uifer characteristics, *Ohio, Hydrologic data, er yield, Pumping, Withdrawal, Water utiliza- , Groundwater movement, Groundwater arge, Water levels.
ntifiers: Pickaway County(Ohio).

he Circleville area in Pickaway County, south- tral Ohio, industrial wells yield 8 million gal- per day from sand and gravel outwash osits in the Scioto River valley. Groundwater ls in the pumped area have been declining e pumping began in the mid-1950's, from 40 to eet below land surface to 75 to 80 feet near the er of the cone of influence. Transmissivities at closely spaced pumping centers were deter- ed by analysis of the cone as 3,575 and 6,100 squared per day respectively. The hydraulic ductivity of the sand and gravel deposits is ut 60 feet per day. The wells are relatively far n the Scioto River, and most of the water drawn is from regional underflow, which is in- epted in transit to the stream. Yields of wells est to the river are sustained, in part, by in- ed infiltration. This component is expected to ease as the cone of influence grows in response to withdrawal by industry. For optimum use of the aquifer, future pumping could be spread over a larger area, and the new wells could be drilled outside the present cone of influence. Elsewhere in the Circleville area, sites are underlain by excellent aquifers, which are capable of yield much more water than is being withdrawn at the present time. (Woodard-USGS)

POTENTIAL OF MADISON GROUP AND ASSOCIATED ROCKS TO SUPPLY INDUSTRIAL WATER NEEDS, POWDER RIVER BASIN, WYOMING AND MONTANA,
Geological Survey, Denver, Colo.
F. A. Swenson.
In: Water Resources Problems Related to Mining: American Water Resources Association Proceedings Series No 18, p 210-218, June 1974. 5 fig, 4 ref.

Descriptors: *Groundwater resources, *Water quality, *Industrial water, *Wyoming, *Montana, Water resources development, Aquifer characteristics, Hydrologic data, Data collections, Water wells, Water yield, Chemical analysis, Water supply, Groundwater potential, Geology, Hydrogeology.
Identifiers: *Powder River Basin(Wyo-Mont).

A large part of the Nation's energy reserves are in the coal deposits of the Powder River Basin in Wyoming and Montana. One of the limiting factors of industrial development of these great energy reserves is the availability of water. Surface-water supplies that have not been appropriated for other uses within the basin are limited. A reconnaissance study began in July 1973 to assess the potential of the Madison Group and other deep carbonate aquifers to supply water needs for energy development of the Powder River strutural basin that lies between the Black Hills and the Bighorn-Pryor Mountains, extending from about Casper, Wyoming, to the Yellowstone River in Montana. Maps have been prepared of this area showing (1) thickness of Madison Group, plus additional carbonate aquifers underlying and in hydrologic continuity with Madison, (2) structure contours showing top of Madison Group, (3) potentiometric map showing the heights to which water will rise in tightly cased wells bottomed in the Madison and other carbonate aquifers, and (4) a map showing lines of equal dissolved-solids concentration in water from the carbonate aquifers. About 40 water wells, some yielding more than 9,000 gallons per minute, with maximum depths exceeding 10,000 feet have been completed. The good quality of the water (for example, 860 milligrams per litre dissolved solids in water from a depth of 8,000 feet and 80 miles from area of recharge) tends to indicate good circulation of water. It appears that signficant quantities of water can be made available from these deep aquifers for industrial development of the energy reserves of this area. (Woodard-USGS)

THE ROLE OF GROUNDWATER IN SPAIN,
National Geology Commission, Madrid (Spain); and Guadalquivir Project, Madrid (Spain).
J. A. Gomez Angulo.
In: Groundwater Seminar, Granada, Report of the FAO/UNDP-Government of Spain Seminar on the Role of Groundwater in the Optimal Utilization of Hydraulic Resources, Granada, October 18-23, 1971, Irrigation and Drainage Paper No 18. Rome, 1973, p 37-51, 7 tab.

Descriptors: *Groundwater mining, *Water resources development, *Arid lands, *Water budget, Groundwater, Groundwater basins, Agriculture, Irrigation, Reservoir storage, Wells, Hydrologic budget, Water resources, Water supply, Groundwater availability.
Identifiers: *Spain(Guadalquivir Project).

Spain hopes to increase groundwater's share of its total water budget from 20% to 50%. While the nation's total groundwater reserves are as yet unknown, those of the Guadalquivir and Segura Basins suggest that these reserves greatly exceed the storage capacity of surface reservoirs that now exist or that may be built in the future at competitive prices. Allowing for artificial recharge operation, groundwater, in close association with surface water and in superior conditions of competition with it, should constitute the basis of Spain's hydrological policy up to the year 2000. Thus, mining groundwater will become increasingly important and necessary for Spain. (See also W76-00807) (Bowden-Arizona)

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Groundwater, *Groundwater mining, *Aquifers, *Water management(Applied), *Aquifer characteristics, *Aquifer management, Overdraft, Recharge, Safe yield, Water resources development, Water budget, Boundaries(Surface), Geohydrologic units, Groundwater recharge, River basin development, Water resources, Water supply, River basins, Streams.

It is today conceivable and technically feasible to plan the tapping of an aquifer and to integrate its management in the broader framework of optimization of use of all water resources of a river basin or a territory. The study of an aquifer for the purpose of assessing its potentialities and uses that are justifiable by economic or financial calculations must be based essentially on research on the following physical data: the geometry of the reservoir; conditions at the confines, in particular its connection with streams and the sources of such streams; its lithology; hydrodynamic conditions; order of magnitude of the reserves; order of magnitude of the natural discharge and replenishment fluctuation pattern. RECHARGING OF UNDERGROUND WATER DEPOSITS,
P. Ruby.
In: Groundwater Seminar, Granada, Report of the FAO/UNDP-Government of Spain Seminar on the Role of Groundwater in the Optimal Utilization of Hydraulic Resources, Granada, October 18-23, 1971, Irrigation and Drainage Paper No 18. Rome, 1973, p 67-74.

Descriptors: *Recharge, *Water pollution, *Aquifer management, *Aritificial recharge, *Saline water intrustion, Groundwater, Safe yield, Overdraft, Water management(Applied), Aquifers, Injection wells, Groundwater recharge, Natural recharge, Infiltration, Storage coefficient, Hydrogeology, Aquifer characteristics, Groundwater basins, Hydrologic aspects, Hydrologic data, Water quality, Geohydrology.
Identifiers: Hydrogeologic survey.

Water is artificially recharged into grounwater deposits when human exploitation exceeds natural recharge, when the artificially recharged water is polluted and the soil acts as a filter, when the aquifer is used as storage for surplus surface water, and when salt water intrusions threaten fresh water aquifers. A review of costs for artificial recharging around the world shows that expenses vary a great deal. Generally, such recharge schemes are site specific and necessitate a thorough knowledge of local factors. However, one thing is needed in every case if one wishes to move away from the empiricism which has only too frequently governed the development of systems for the artificial recharging of water deposits: a good knowledge of these deposits, i.e. the carrying out of a serious hydrogeological survey of the reservoirs and a careful hydrological and physical/chemical survey of the fluid to be injected. TECHNICAL, ECONOMIC AND ORGANISATIONAL ASPECTS OF THE EXPLOITATION OF GROUNDWATER RESOURCES,
Gaudalquivir Project, Madrid (Spain).
A. Bouton
In: Groundwater Seminar, Granada, Report of the FAO/UNDP-Government of Spain Seminar on the Role of Groundwater in the Optimal Utilization of Hydraulic Resources, Granada, October 18-23, 1971, Irrigation and Drainage Paper No 18. Rome, 1973, p 75-90, 2 tab.

Descriptors: *Well drilling, *Rotary drilling, *Drilling equipment, *Water management(Applied), *Groundwater, Costs, Core drilling, Drilling, Casings, Drillers logs, Drilling fluids, Subsurface investigations, Clays, Aquifers.
Identifiers: Spain(Guadalquiver Project).

Although crude drilling techniques limited the exploitation of many aquifers in the past, modern methods and machinery have greatly expanded the number and kind of aquifers which can now be exploited. Cost of the water, based on the price of the drilling equipment, life of the well, and volume of water obtained are the major factors in determining whether drilling is viable. Costs and practices of drilling work of different nations are given. To insure that groundwater resources be protected, an official drilling authority, professional training, industrialization, and appropriate legislation area suggested. GROUNDWATER RESOURCES: EVALUATION AND EXPLOITATION,
Arizona Univ., Tucson. Dept. of Geoscience.
J. W. Harshbarger.
In: Groundwater Seminar, Granada, Report of the FAO/UNDP-Government of Spain Seminar on the Role of Groundwater in the Optimal Utilization of Hydraulic Resources, Granada, October 18-23, 1971, Irrigation and Drainage Paper No 18. Rome, 1973, p 91-118, 25 ref.

Descriptors: *Groundwater, *Groundwater mining, *Water management(Applied), *Sustained yield, *Aquifer management, Safe yield, Water resources development, Subsurface investigations, Overdraft, Recharge, Models, Computer models, Irrigation, Agriculture, Aquifer characteristics, Wells, Aquifers.

The concept of safe yield in the development and management of groundwater reservoirs has been supplanted by that of sustained yield, based on replenishment factors, aquifer mechanics techniques, and interception of discharge components. Data obtained from projects designed for aquifer appraisal can be examined with analytical and computer model simulation, its accuracy being dependent upon the reliability of the data used in the simulation of the water system. It is necessary not only to consider surface and groundwater sources together as a total resources, but to maintain data, assessment, and interpretation on a continuing basis. SOME FACTORS INFLUENCING GROUNDWATER DEVELOPMENT AND USE FOR AGRICULTURE,
Food and Agricultural Organization, Rome (Italy). Land and Water Development Div.
C. E. Houston.
In: Groundwater Seminar, Granada, Report of the FAO/UNDP-Government of Spain Seminar on the Role of Groundwater in the Optimal Utilization of Hydraulic Resources, Granada, October 18-23, 1971, Irrigation and Drainage Paper No 18. Rome, 1973, p 119-144, 16 ref.

Descriptors: *Water law, *Irrigation, *Groundwater mining, *Water management(Applied), Legislation, Groundwater, Groundwater basins, Water resources development.

Improved use of present water supplies and development of additional supplies for irrigation will be necessary to provide the increased food supplied needed in future decades. Groundwater is the most plentiful source of fresh water but all waters should be considered as one common resource. Insistence upon the total approach will require the expeditions use of a large number of essential complementary inputs. Groundwater development for agriculture has some decided advantages over surface water development. There is a need for national groundwater policies concerning investigations, utilization, and conservation, the maximum use of the resource. The also a need for new legislation for controlling vestigation, recovery and utilization of grou water. This, too, should be aimed at the beneficial and maximum use of the resou Finally, successful irrigation requires the sk combination of accumulated knowledge in n professional fields, including: engineering; w soil and plant sciences; economics; and othe cial sciences. Preparation of project proposals their appraisal, as well as project implement and management call for experienced judge based on a high degree of professional petence. A major argument for careful planni groundwater exploitation has been the experi and problems rampant in arid lands. (See W76-00807) (Bowden-Arizona)

Groundwater is generally water of high qu requiring no treatment. Surface supplies r from high quality water requiring convent processing such as coagulation, decantation, f tion, and careful sterilization, to water of quality whose processing and use are not practical. An economic survey was carried between high quality groundwater (requirin treatment) and high quality water which req minimum treatment. Groundwater was the economical for urban water supplies. THE ROLE OF GROUNDWATER IN THE TIMUM UTILIZATION OF WA RESOURCES,
Guadalquivir Project, Madrid (Spain).
F. Mortier.
In: Groundwater Seminar, Granada, Report o FAO/UNDP-Government of Spain Seminar o Role of Groundwater in the Optimal Utilizatio Hydraulic Resources, Granada, October 1 1971. Irrigation and Drainage Paper No 18. R 1973, p 166-185.

Descriptors: *Groundwater, *Surface wa *Conjunctive use, *Planning, Water man ment(Applied), Surface-groundwater rela ships, Water resources development, Aqui Optimization, Water utilization.

Optimum utilization of water resources is def as that which makes use of resources which limited and variable qualitatively and quantita ly in time and space, adequately and at least to the community. In a comparison of the cha teristics of surface and underground w stratification, water quality, flow, and exploit are described; while the role of groundwater i optimum utilization of water resources focuse the role of storage, regularization, and veyance, as well as the economic role of the ploitation of groundwater. In discussing the c

d use of surface and underground water urces, examples in California, the Indus in, and Mancha in Spain are presented. The ulate justifying the combined utilization of er resources is that the total of economically loitable resources can be increased, with the antages of this conjunctive use being a larger age capacity, profiting by the transport role ed by aquifers, possibility of development in es, and the knowledge that winter use of sur- water for power generation can be offset in mer when agricultural needs are met by winter ndwater recharge. Drawbacks include eralization, costs, technical difficulties, com- ated management. (See also W76-00807) ylore-Arizona)

B. Fiering.
Groundwater Seminar, Granada, Report of the O/UNDP-Government of Spain Seminar on the e of Groundwater in the Optimal Utilization of draulic Resources, Granada, October 18-23, 1. Irrigation and Drainage Paper No 19. Rome, 3, p 186-195.

scriptors: *Groundwater, *Model studies, nulation analysis, *Synthetic hydrology, athematical models, Planning, Computer dels, Hydraulic models, Optimization, Irriga- programs, Reservoir operation, Aquifer nagement, Continuity equation.

role of computers, mathematics, and of opera- s research, and relationships between proto- e problems and their mathematical counter- ts in groundwater analysis are discussed. eral cases in an irrigation program are used to sent solutions based on these model calcula- s, consisting of sets of decisions meeting con- ints and optimizing the objective functions. In e 1, the objective is to maximize the net efits, consisting of the agricultural benefit us the recreation loss minus the total costs, all ject to certain constraints, most of which cribe reservoir storage-release, aquifer rage-withdrawal, and the law of continuity. se 2 adds a budgetary constraint, where the ob- tive function is to maximize gross benefits, ulting in a solution differing from that obtained Case 1. Case 3 seeks to minimize the total cost demonstrate at the same time that optimiza- n is not necessarily maximization. A distinction nade between solution and decision, where the imal decision is the set of variables and the op- al solution is the value of the objective function ociated with these optimal decisions. A small nge in the decision can produce a large change solution, and vice versa. Clearly such ground- ter analyses are of the highest value in arid ds where water scarcity multiplies the worth of drologic resources. (See also W76-00807) ylore-Arizona)

MULATION MODELS FOR CONJUNCTIVE E OF SURFACE AND GROUNDWATER,
rvard Univ., Cambridge, Mass.
B. Fiering.
Groundwater Seminar, Granada, Report of the O/UNDP-Goverment of Spain Seminar on the le of Groundwater in the Optimal Utilization of draulic Resources, Granada, October 18-23, 1, Irrigation and Drainage Paper No 18. Rome, 3, p 196-222, 17 fig, 1 tab.

scriptors: *Groundwater, *Conjunctive use, rface-groundwater relationships, *Model stu- s, *Synthetic hydrology, Asia, Computers, thematical models, Simulation analysis, onomics, Economic prediction, Aquifer charac- istics, Aquifer management, Water resources velopment.
ntifiers: *Pakistan, Indus River(Pakistan).

A simulation model for the plain of the Indus River in West Pakistan is used to describe the conjunctive use of surface and groundwater with an objective of maximization of agricultural productivity. The mathematical problem was to determine the proper setting for making the proper investment decisions. Seven basic assumptions wwere made in the simulation: (1) the surface and groundwater elevations are assumed to be horizontal in the area; (2) the depth to groundwater is everywhere uniform in the zone subtended by a single well; (3) the seasonal inputs of flow and precipitation are presumed to derive from bivariate log-normal distributions; (4) the feedback relationships can be represented by a deterministic component with a suitably distributed random additive component; (5) all depth-dependent flow vectors are initially approximated using the groundwater depth; (6) the ground surface and the bottom of the aquifer provide boundaries beyond which groundwater cannot migrate; and (7) all accretions and withdrawals from the groundwater occur uniformly over the entire area. (See also W76-00807) (Robinett-Arizona)

APPLICATION OF SYSTEMS ANALYSIS MODELS TO THE PROBLEM OF CONJUNCTIVE USE OF SURFACE AND GROUNDWATER IN THE VEGA OF GRANADA,
Instituto Geologico y Minero de Espana, Madrid.
D. Alvarez Fernandez, R. J. Delucia, M. B. Fiering, D. F. Luecke, and Q. T. Nguyen.
In: Groundwater Seminar, Granada, Report of the FAO/UNDP-Government of Spain Seminar on the Role of Groundwater in the Optimal Utilization of Hydraulic Resources, Granada, October 18-23, 1971, Irrigation and Drainage Paper No 18. Rome, 1973, p 223-262, 9 fig, 1 tab.

Descriptors: *Groundwater, *Conjunctive use, *Surface waters, *Surface-groundwater relationships, *Model studies, *Systems analysis, Europe, Computers, Synthetic hydrology, Mathematical models, Simulation analysis, Aquifer management, Water resources development, Water management(Applied), Optimal development plans.
Identifiers: *Spain, Vega of Granada(Spain), High Genil Basin(Spain).

A combination of systems analysis techniques were utilized on problems of conjunctive use of surface and groundwater in the Vega of Granada, Spain. The study introduced the use of systems methodology to the planning efforts for this area and developed a set of models which demonstrated the usefulness of these techniques and should provide the basis for aiding in the definitive selection of the joint surface and groundwater development options. The techniques employed were those of storage yield analysis using synthetic hydrology and mathematical programming models to examine both capacity and operation questions. Initial programming solutions combined with the storage yield analysis indicate that the range of attractive alternatives appears to consist of significant development of the groundwater resources but only very limited extensions of the surface water capacity in certain sub-areas. The ability of systems analysis models to examine the many simulation tradeoffs that must be made in selecting the optimal development plan for such systems had been demonstrated in a growing number of water resources systems over the last decade. This study should be an initial step in the introduction of these techniques into the planning process in Spain. (See also W76-00807) (Bowden-Arizona)

COMPUTATION OF ECONOMIC DATA CONCERNING THE EXPLOITATION OF GROUNDWATER ON A REGIONAL SCALE,
Northern Sahara Water Resources Study Project, Alger (Algeria).
P. Pallas, V. Pietraru, and D. Huault.
In: Groundwater Seminar, Granada, Report of the FAO/UNDP-Government of Spain Seminar on the Role of Groundwater in the Optimal Utilization of Hydraulic Resources, Granada, October 18-23, 1971, Irrigation and Drainage Paper No 18. Rome, 1973, p 263-285, 3 fig, 4 tab.

Descriptors: *Economics, *Groundwater, *Africa, *Model studies, *Water resources development, Mathematical models, Economic feasibility, Planning, Water management(Applied), Aquifer managment, Water yield, Wells, Costs, Water utilization, Groundwater resources, Synthetic hydrology, Water wells, Water supply.
Identifiers: Sahara, Sahara Desert.

In order to provide information on the investment and operating costs involved in the exploitation of groundwater on the scale of a region located in the Northern Sahara, a computational method was developed that makes it possible to transform data provided by hydraulic mathematical models into economic terms. The proposed computation may be subdivided into: computation of the real water level in a well from the level calculated for one square in the grid by means of prediction models; computation for one square in the grid of the number of wells that is necessary in order to obtain the required quantity of water and choice of the economically most advantageous variant (artiesian or pumped); economic computation on the regional scale, yielding a calendar of investments for water production and the mean cost per cubic meter of water and its variation with time. W76-00819

SOME ASPECTS OF GROUNDWATER EXPLOITATION AND THE USE OF GROUNDWATER MODEL IN THE MIRES BASIN IN CRETE, GREECE.
In: Groundwater Seminar, Granada, Report of the FAO/UNDP-Goverment of Spain Seminar on the Role of Groundwater in the Optimal Utilization of Hydraulic Resources, Granada, October 18-23, 1971, Irrigation and Drainage Paper No 18. Rome, 1973, p 286-290.

Descriptors: *Groundwater, *Irrigation, *Economic feasibility, *Water resources development, *Model studies, Agriculture, Europe, Water management(Applied), Computers, Systems analysis, Mathematical models, Synthetic hydrology, Aquifer management, Water supply, Groundwater resources, Water utilization, Aquifer characteristics, Groundwater basins, Hydrologic aspects, Hydrologic subject.
Identifiers: *Greece, *Crete, Messara Valley(Crete).

The groundwater basin of Mires in the Messara Valley on the Island of Crete has an average annual groundwater flow of approximately 26 cubic hectometer out of which only about 5hm3 are being used at present. The full exploitation of the annual flow would allow irrigation of more than two times the surface of the basin area. The question is whether it will be technically and economically feasible to reach this aim, the crucial point being the pumping pattern. As an approach to the answer a digital groundwater model has been used which enabled simulation of the reactions of the hydrogeological system on varying conditions of exploitation. TEMPLETON V. HUSS (ACTION FOR INJUNCTIVE RELIEF FOR INCREASED SURFACE WATER RUNOFF).
311 N.E.2d 141 (Ill 1974).

Descriptors: *Surface runoff, *Riparian rights, *Judicial decisions, *Illinois, Runoff, Agricultural runoff, Drainage water, Water sources, Water supply, Water resources development, Water law, Surface waters, Base flow.
Identifiers: *Injunctive relief, *Common enemy rule.

Plaintiff sought injunctive relief against subdividers for converting their parcel of farmland into a residential subdivision resulting in an increase in the amount and rate of surface water runoff flowing onto plaintiff's land. Plaintiff also sought relief from the village for approving plans for the subdivision and accepting the dedication of streets when it knew or should have known that alterations of the course of nature would cause water to flow onto plaintiff's land. The defendants contended that the owner of the dominant estate has an unlimited right to alter the surfacewater drainage of his land as long as the water is not diverted from another watershed. The Supreme Court of Illinois found for the plaintiff and held that the increased flow of surface waters to the adjoining landowner was beyond a range consistent with the policy of reasonableness which led to the 'good husbandry' exception to the Drainage Act of 1885. EVALUATION OF EFFECTS OF LAND-USE CHANGES ON STREAMFLOW,
Geological Survey, Menlo Park, Calif.
D. R. Dawdy, and J. M. Bergmann.
In: Agricultural and Urban Considerations in Irrigation and Drainage: Selected Papers from the Irrigation and Drainage Division Specialty Conference, Fort Collins, Colorado, April 22-24, 1973. American Society of Civil Engineers, New York, p 619-626, 1974. 2 tab, 3 ref.

Descriptors: *Environmental effects, *Land development, *Streamflow, *Hydrologic models, *Storms, *Land use, Planning, Forecasting, Watershed management, Flood frequency, Flood data, Hydrologic data, Evaluation, Urbanization, Agriculture.

Deterministic structure-imitating hydrologic models can be an invaluable tool for predicting the changes in streamflow that will result from changes in land use. The relative magnitude of the change in streamflow resulting from a given change in land use will vary inversely with storm severity. The user of the hydrologic model should be aware of its limitations--a degree of error is inherent in every model and that error is usually compounded by uncertainties in the prediction of change in land use. The Proposed Big Cypress National Fresh W Reserve involves the acquisition over a 10-y period of 547,000 acres of lands in southw Florida. Preservation of the watershed, ecosystem and water supplies of nearby citie the aim of the proposal. The area is mainly aqu and supports a diversity of rare plant and ani forms which are endangered by the draining, m ing, and other development by the surround communities. Support for preservation of the a began when the City of Miami began construct of a jetport in the area. In addition to preserv the water supply, acquisition of the Big Cypr watershed will restore the ecosystem and enha the chance of survival of the 21 rare and end gered species living there. There are no expec adverse environmental effects of the proposal no action is taken, drainage and development p jects will destroy the watershed. The other alter tive is to use methods other than acquisition preserve the area. Zoning measures appear adequate because of the time required to appr and implement regulations by several levels government. Creation of an environmental trust public corporation for control of the area invol similar problems of coordination. Federal co pensable land use regulations have never be adopted and would require federal legislation. T short-term effect of the proposal prevents furt exploration of the area's resources; the long-te effect insures preservation of the watershed. T only irretrievable commitment of land is t designated for recreational use. Supplemental s dies include an earlier Environmental Imp Statement by the Department of the Interior, an hydrologic survey by the U. S. Geological Surv (Jenkins-Florida)

Identifiers: *Declaratory judgment, *Injuncti relief.

Action was brought by a municipality for declaratory judgment and injunctive relief prevent the erection of defendant's public obs vation tower on the beach. Defendant, a Flori corporation, owned waterfront property in the m nicipality and operated an ocean pier as a tour attraction and recreation center. Plaintiff c

erated an observation tower near the site of de-ndant's pier and protested the construction of efendant's tower. Plaintiff alleged that by con-nuous use of the property for more than 20 years, e public had acquired an exclusive prescriptive ght to use the land of the defendant. The preme Court of Florida held that even if the blic had acquired an easement by prescription to used areas of the defendant's ocean front par-l, the owner could make any use of the land con-stent with, or not calculated to interfere with, the ercise of the public easement. NVIRONMENTAL ASPECTS--SACRAMENTO ANK PROTECTION,
rmy Engineer District, Sacramento, Calif. Water esources Planning Branch.
S. Mifkovic, and M. S. Petersen.
ournal of the Hydraulics Division, Proceedings of SCE, Vol 101, No HY5, p 543-555, May, 1975. 7 g, 5 ref.

escriptors: Bank protection, *Flood control, Rivers, *Erosion control, *Watershed manage-ent, Wildlife conservation, Levees, Construc-on, Recreation facilities, *California.
lentifiers: *Sacramento Valley(Calif).

hile flood control in the Sacramento River Val-y has been practiced for several years, little con-rn was given to riparian vegetation and wildlife ong the river banks. For this reason, many aches of the Sacramento River where bank pro-ction work was performed have now eroded, pleting berm areas and attacking the levees. This per examines alternative design and construc-on practices that are under study by the Sacra-ento District, Corps of Engineers, to minimize dverse environmental effects. Some studies are ing implemented on a test basis, such as the ild and Scenic Rivers Study, which is evaluating vironmental resources and inter- relationships, ysical characteristics of the river, water quality d use, recreation potential, land use, and social d cultural development. Possible modifications preserve the environment which are being con-dered are: selective clearing and retention of getation with replacement at construction sites; storation of berm areas; steeping the protected ope to preserve existing berm areas; requiring nstruction to be from the waterside with floating uipment; reducing the top of rock revetment to a gh sustained flow level; and including recreation cilities at selected construction sites. The basic concepts of watershed modeling are explored and a working model is developed for the forested zone areas in the Yakima River Basin of Washington. The model follows the general approach developed by Fordam at the Desert Research Institute, Reno, Nevada. Precipitation and temperature information are traslated into estimates of snowpack, snow melt, groundwater storage and, finally overland and groundwater flows. A FORTRAN program, calibrated for Yakima Basin conditions is used to estimate changes in total runoff and seasonal patterns. A particular application is made to changes in runoff following clearcut timber harvesting over various proportions of the watershed surface. (McKenzie-Washington State)

Descriptors: *Streamflow, *Flow duration, *Fish populations, *Trout, Standing crops, Average flow, *Watershed management, Fish reproduction, *Wyoming, Average flow.
Identifiers: Trout productivity, Watershed parameters, Minimum streamflow, Average daily flow.

The objectives were twofold: to aid in determining suitable streamflow recommendations for trout through the use of flow duration values, and to develop an index of potential trout productivity, utilizing watershed parameters that were found to be significantly related to standing crop estimates. The 25 percent recommended average daily flow level was equaled or exceeded an average of 55 percent of the time during the summer months in streams with good trout populations, as compared to an average of 15.8 percent of the time in streams with poor populations. Seven watershed parameters were significantly related to standing crop estimates in small Wyoming streams. Four of them--drainage area, total stream length, mean basin elevation, and forested area--were utilized in developing an index equation for the potential trout productivity. Calculated results of the index show a general relationship between geomorphic characteristics and standing crop estimates.

THE POTOMAC, 1974 ANNUAL REPORT.
Interstate Commission on the Potomac River Basin, Bethesda, Md.
Annual Report, 1974. 26 p, 4 illus, 18 photo, 1 chart.

Descriptors: *Watersheds(Basins), *Potomac River, *Interstate commissions, *Pollution abatement, *History, Maryland, Virginia, District of Columbia, Acid mine water, Administrative agencies, Algal control, Sedimentation, West Virginia, Dams, Reservoirs, Swimming, Water purification, Watershed management, Federal Water Pollution Control Act, Industrial wastes, Flood control, Water sampling.
Identifiers: Shenandoah River, Non-point pollution, Cancer producing agents, Drinking water, Interstate Commission on the Potomac River Basin(ICPRB).

Improvements are depicted that have been made in the Potomac River watershed. Beginning with a Presidential declaration in 1965 that the Potomac would be safe for swimming within ten years, a sustained multi-state effort has reclaimed waters from mine acid contamination, insufficient sewage treatment, and various types of non-point source pollution such as land runoff that add sediment thereby clogging areas downstream. Since the Potomac basin supplies drinking water for millions of people in the Maryland--Virginia--District of Columbia area, the discovery of possible cancer producing agents in Potomac waters has stimulated great concern. However, control projects such as dams and reservoirs are not always popular since the area is heavily populated and of great historical importance. The main responsiblity for reclaiming the river and for reconciling the diverse needs of its users rests with the Interstate Commission on the Potomac River Basin (ICPRB), established in 1940. Under the 1972 Amendments to the Federal Water Pollution Control Act, the Commission's activities have greatly expanded to include all areas of river supervision. (Parrish-Florida)

MAJOR FLOODS, POOR LAND USE DELAY RETURN OF SEDIMENTATION TO NORMAL RATES,
Forest Service (USDA), Berkely, Calif. Pacific Southwest Forest and Range Experiment Station.
H. W. Anderson.
Research Note PSW-268, 1972. 4 p, 1 fig, 1 tab, 9 ref.

Descriptors: *Watershed management, *Forest management, *Lumbering, Grasslands, *Erosion, Suspended sediment, *Water quality, *Floods, Geomorphology, Sediment transport, Forecasting, *Land use.
Identifiers: Logging effects, Vegetation type conversion, Sediment delivery processes.

When suspended sediment concentrations are suddenly accelerated by factors of 5 or more the hydrogist making predictions of long-term sedimentation is in trouble. Recovery from flood accelerated sedimentation influences both estimates of average long-term sedimentation and short-term monitoring of sedimentation changes. But, these accelerations and their decline are at least in part predicable. Analyses of the 'years to return to normality' were made for 10 northern California watersheds following the accelerations in average sediment concentration associated with the December 1964 flood. Returns to normalcy took from zero to 9 years, with the rate of decline being related both to the amount of initial acceleration

LIBRARY U. OF I. URBANA-Univ. Illinois

and watershed differences. Explained variance in years to recovery increased with the coefficient of path lengths in the watershed, with the area of poor logging, with the area of steep grassland, and with the percent of area in the sedimentary rock types Cenozoic or younger. Thus, part of the delayed recovery was attributed to sediment in transit released by the major flood and part to recovery of sediment source areas from the impact of the floods. Sediment determinations during flood versus non-flood periods may alter estimates by a factor of 2 or more. (Forest Service)

Descriptors: *Storm runoff, *Overflows, *Monitoring, Organic compounds, Infrared radiation, Sewage disposal, Analytical techniques, Storm water, Rivers, Automation, Organic wastes, Pollutant identification.
Identifiers: *Total Organic Carbon(TOC).

A method for assessing the organic content of incoming combined sewage during storm water periods is necessary to permit programming overflows. The ultimate objective of this study was to design a device for the automatic and rapid on-site monitoring loading of strom and combined sewer flows. Evaluation of the instrumentation necessary for a reliable Total Organic Carbon (TOC) measurement indicated that the best system would be one based on total oxidation of sewage and infrared detection of the carbon dioxide. Although no commercially available automatic monitoring system is suitable for sorm water service, it is believed that most of the components to build such a system are available. Tests are being conducted to establish sample processing, modifications on the engineering model, and accumulation of the continuous monitoring data on TOC content of storm and combined sewers. Identifiers: *Dissolved inorganic phosphate, Sample storage, Chemical preservatives, *Fall Creek(NY), Stream samples, Isobutanol extraction procedure, Autoanalyzer.

The influence of storage conditions and duration of storage was studied by using about 100 stream samples from Fall Creek collected near Ithaca, New York. Freezing and refrigerated storage were found to be unsatisfactory, since changes in measured concentrations were usually observed after relatively short periods of time (24 hours). An isobutanol extraction procedure was described which minimizes storage problems and is useful for routine analysis of water samples for dissolved inorganic phosphate. (Henley-ISWS)

Identifiers: *Radiation dosimeters, *Thermoluminescence characteristics, *Dosimeters, Ionizing radiation, Radiation exposure, Glow curve area, Exposure level, Cobalt 60.

Two empirical methods oflusing soils as ionizing radiation dosimeters were presented. These methods were derived through the use of the thermoluminescence characteristics of soils. Method A was designed for irradiated soils for which pre-irradiation collection of the soils was available. This method is workable for maximum radiation exposure levels up to about 480,000 roentgens. Method B was designed for irradiated soils for which pre-irradiation collection of them was not available. This method is workable for maximum radiation exposure levels up to about 5,000 roentgens. Some of the reasons for the discrepancy in the sensitivity between the two methods were discussed. Various factors that influence the measurement of soil thermoluminescence were noted. (Henley-ISWS)

Identifiers: *Chlorinated hydrocarbons, *Ne leans(La), *Aliphatic compounds.

Low molecular weight volatile organic compo were thermally extracted from water sample fore, during, and after processing by a New ans, La., municipal water treatment plant. Be artesian water and water from a charcoal filt deionizing unit were also examined. The vo compounds were trapped on a solid polyp ether adsorbent and resolved by high resol gas chromatography. A gas chromatograph-spectrometer-computer combination was us identify major aromatic and halogenated alip components. About 70 organic constituents c detected in any single analysis of liter size. Mo these organics are either aromatic or haloge aliphatic and aromatic. The major constituer finished water are benzene, carbon tetrachlo dichloroethane, bromodichloromethane, chloroform. The concentrations of halogenated and aromatic organics such trichloroethylene, 2- or 1-naph dichloromethane, and xylene are unchange passing through the treatment plant. The co

ions of dichloroethylene, chloroform, zene, carbon tetrachloride, dichloroethane, modichloromethane, toluene, and romochloromethane are enhanced greatly in water treatment process. This increase in contrations indicates that they are formed by orination of precursor organic molecules. The anics in the bottled artesian water were the ne as those in the finished water. Variations in anics present and their relative concentrations ied from bottle to bottle. The preliminary data gests that further studies are needed to deter- ne the value of charcoal filtering for potable er production. (Orr-FIRL)

uipment and systems for monitoring water lity parameters both in plant and streamside discussed. In-situ system measurement makes of a submersible cluster of sensor which mea- e the parameters at the point of submersion. s is a simple system to use when environmental ditions permit. The most common method of aining water samples is to pump from the rce to some location where the sensors are used. This system is characterized by the arately mounted pump with piping to the mea- ing equipment which is located in a separate lter or space within the plant. The factors ich aid in a determining the location of the sam- g site and the mounting and anchoring facilities lude the type of water, annual water level data, l flood level and flood history. The kind of ris that may be in the water course should also considered when choosing the type of equip- nt and site. The preferred pump is the positive placement type. The most common method of unting is to support the pump by a pipe from a r, truss, bridge, or bulkhead. A pump can be unted in a still well for protection from the ather. A slanted stillwell is becoming increas- ly popular. Debris screens will help to keep the ris out of the system but many of the available eens are difficult to position and too small. The mbing can be critical because of the debris. The ing should be laid out to minimize sharp bends, nges in cross section, and areas for sediment to lect. The pressure regulation that most systems uire in order to function properly can be ac- nplished with a bypass or discharge valve. (Orr- RL)

investigation was conducted to determine the emical composition of dissolved organic matter OM) in the water of the Tamagawa River, near kyo, in November 1972 and May and November 73. Samples were filtered through glass fiber fil- s for analysis. The percentage of each chemical mponent to the total DOM was as follows: carbohydrates, 16-18%; protein, 29-36% (amino acids, 25%); lipids, 3%; urea, 1%; and ABS, 9-16%. The percentage of protein (nitrogen containing compounds) was larger than that of lipids (ether extractable compounds) was smaller than had been observed in seawater samples. ABS derived from detergents was also present in large amounts in the Tamagawa River samples. In addition, trace organic compounds including fatty acids, sterols, polyaromatic hydrocarbons, BHC and phthalate esters were found in these samples. (Kramer-FIRL)
W76-00606

DETERMINATION OF ORGANIC CARBON IN WATER USING A PCO2 ELECTRODE, (IN JAPANESE),
Asahi Glass Co., Yokohama (Japan). Research Lab.
M. Noshiro, and T. Yarita.
Bunseki Kagaku, (Japan Analyst), Vol 24, No 6, p 390-391, June, 1975. 1 fig, 1 tab.

Descriptors: *Organic matter, *Pollutant identification, *Electrodes, Analytical techniques, Measurement.
Identifiers: *Total organic carbon, Sensors, PCO2 measurement.

The concentration of total organic carbon in water may be measured with a PCO2 electrode as a sensor. The feasibility of this method was studied. Because nitrogen in air is coverted into NOx which interferes with the PCO2 measurement, oxygen carrier gas (300 ml/min) rather than air, was used. A sample combustion chamber was maintained at 800 C and an oxidation chamber was operated at 600 C. Carbonaceous materials were oxidized to carbon dioxide with a Pt-Rh catalyst on alumina; water vapor was removed at room temperature by a cooling trap; carbon dioxide was absorbed in 2 ml of 0.5 M NaOH solution. The solution was acidified with one ml of 2 M HCl and introduced into a cell, where the potential of a PCO2 electrode could be measured. The content of total organic carbon in the sample was calcualted from a calibration curve obtained with the standards solution in the same manner. Analysis time was about eight minutes, precision about plus or minus 20%. (Kramer-FIRL)

DEVELOPMENT OF A GROSS POLLUTION DETECTOR: LABORATORY STUDIES,
Severn-Trent Water Authority, (England).
G. J. Holland, and A. Green.
Water Treatment and Examination, Vol 24, Part 2, p 81-99, 1975. 6 fig, 6 tab, 4 ref, 2 append.

Descriptors: *Monitoring, *Water pollution, *Nitrification, *Ammonia, *Pollutant identification, Rivers, Toxins, Water pollution sources, Water quaility, Analytical techniques, Electrodes.
Identifiers: Ammonia-ion electrode.

The development and testing of a gross pollution detector (GPD) is discussed. The monitoring system was based on a continuously operating percolating filter in which nitrifying organisms were selectively cultured. A specific-ion electrode was used to indicate changes in the rate of nitrification of ammonia. Numerous compounds have been found which could inhibit nitrification. The media was carefully graded 20 mm granite chippings, supported in a PVC tube. The term 'Toxicity threshold concentration' was devised from the relative toxicities of the substances tested and means 'that concentration of pollutant which will bring about a 50% inhibition of nitrification'. The toxicity threshold concentration is determined by plotting the maximum percentage inhibition against concentration for each of the concentrations used and determining the concentration that would result in 50% inhibition. The investigation showed the basic soundness of the concept of using the automatic detection of the inhibition of nitrification as a warning of the presence of pollution. More evaluations of this monitoring system should be performed. (See also W76-00610) (Orr-FIRL)

DEVELOPMENT OF A GROSS POLLUTION DETECTOR: FIELD TRIALS,
Severn-Trent Water Authority, (England).
K. C. G. Stroud, and D. B. Jones.
Water Treatment and Examination, Vol 24, Part 2, p 100-119, 1975. 7 fig, 1 ref, 1 append.

Descriptors: Rivers, *Pollutant identification, On-site tests, Potable water, Effluents, Ammonia, Waste water treatment, *Inhibition, *Analytical techniques.
Identifiers: Gross pollution detectors.

A detector for gross pollution in rivers was developed by the Severn-Trent Water Authority, Great Britain. The operating principle of the detector is based on the inhibition of pollutants by bacteriological oxidation of ammonia in a nitrifying column. Field trials on a series of rivers were conducted in order: to identify and try to overcome problems associated with using the gross pollution detector on actual river sites; to determine if the detector could be developed into a reliable plant which could be installed at any station; and to learn how well the detector operated on rivers carrying a range of pollution loads. Field trials were conducted on the following rivers: Severn, a relatively unpolluted river but one often having high turbidity and used for water supply; Bourne, a smaller river used for potable water, carrying effluents from several sewage works, having heavy silt during flood periods; Blythe, having a high proportion of sewage effluents for a potable water source; Cole, polluted and not a water supply source; and Tame, badly polluted. After two years of trials and improvements, the reliability of the nitrifying column and the specific ion electrode for ammonia were demonstrated. Once the nitrifying column had achieved its optimum efficiency it ran for several months continuously and the ammonia concentration in the effluents was not affected by other river characteristics. (See also W76-00609) (Kramer-FIRL)
W76-00610

USE OF A MOBILE LABORATORY FOR POLLUTION DETECTION,
Bristol Waterworks (England).
E. R. Gardiner, and L. R. Bays.
Water Treatment and Examination, Vol 24, Part 2, p 120-131, 1975. 1 ref, 1 append.

Descriptors: *On-site laboratories, *Pollutant identification, Rivers, Phenols, Heavy metals, *Analytical techniques, Laboratory equipment, Water pollution control.
Identifiers: *Mobile laboratory, Gross pollution detector, Severn River Authority.

The function of a vehicle for pollution detection in rivers is discussed. This mobile laboratory has been designed for immediate action in the case of pollution and not as a replacement for existing fully-equipped laboratory facilities. Since the development of a Gross Pollution Detector by the Severn River Authority, an increased number of warnings should be given, and it is hoped that the mobile laboratory will facilitate faster identification of point source pollutants. The mobile laboratory should be able to arrive at a site, take a sample for immediate analysis and one for a retention and return to the main laboratory, place two guppies in a portion of the sample for observation, and run several analyses such as odor, visible pollution, pH, temperature, dissolved oxygen, organophosphorus, organochlorines, and heavy metals. In two cases cited, the mobile laboratory was able to detect and trace the source of pollution discharges within two to three hours of dispatch. The specific laboratory methods employed by the

LIBRARY U. OF I. URBANA-CHAMPAIGN

mobile unit to detect phenols, arsenic, ammonia, heavy metals, lead, copper, zince, hexavalent chromium, cadmium, cyanide, thiocyanate, organophosphorus compounds, organochlorine compounds, and herbicides are outlined. (Kramer-FIRL)

X-RAY FLUORESCENCE ANALYSIS OF TRACE METALS IN WATER BY MEANS OF CONDENSATION DEPENDING ON ADSORPTION BY ACTIVE CARBON (KASSEI TAN KYUCHAKUHO NI YORU SUICHU BIRYO KINZOKU GENSO NO KEIKO X-SEN BUNSEKI),
M. Yamaguchi, and H. Shiio.
Nagoya-shi Kogyo Kenyusho Kenkyo Hokoku, (Research Report of Nagoya Municipal Industrial Research Institute), No 53, p 5-8, 1975. 10 fig, 1 tab, 5 ref.

Descriptors: *Pollutant identification, *Trace elements, *Metals, *Copper, Nickel, Chromium, Analytical techniques, Spectroscopy, X-ray spectroscopy, Chelation, *X-ray fluorescence.
Identifiers: Japan, EDTA, Trace metals.

The trace metals Cu, Ni, and Cr in water were analyzed by chelation with EDTA, followed by adsorption on activated carbon, placement of the carbons on coated filter paper with PVA, and x-ray spectrography. The x-ray intensity of adsorbed activated carbon with the chelated metals was two times that of non-chelated metals. The sensitivities, when 0.2 g activated carbon were added to 100 ml analytical water, were 0.1 ppm for copper, 0.04 ppm for nickel, and 0.04 ppm for chromium. The three types of trace metals may be analyzed by x-ray techniques simultaneously, as one does not affect the accuracy of the measurement of the others. (Kramer-FIRL)
W76-00612

A CONTINUOUS GARGANTUAN TASK FOR SEVERN TRENT,
Severn Trent Water Authority (England).
D. Brewin, and J. Tapson.
Water, No 4, p 23-26, July, 1975. 3 ref.

Descriptors: *Water supply, *Administration, *Water treatment, *Waste water treatment, *Data collections, Publications, Water quality control, Water analysis, Water districts.
Identifiers: *Severn Trent Water Authority (UK).

As one of its first tasks the Severn Trent Water Authority commissioned 'Water Quality 1973', a document containing in one volume water quality data covering the whole water cycle. The preparation of this report is discussed. The report required data collection from a variety of sources and this variety led to many difficulties in unifying the data presentation. In addition there were also legal difficulties and many unforeseen problems. Prior to April 1, 1974, the management of water services was the responsibility of 26 statutory water undertakings, 210 local authorities, two drainage authorities and two river authorities within the Severn Trent area. Most of the former authorities had water quality data already processed and on file. It was decided to use this data, obtained over a period immediately prior to reorganization, in 'Water Quality 1973'. Gathering of the data required for the production of 'Water Quality 1973' highlighted the inadequacies of much of the data. 'Water Quality 1973' is the baseline report of water quality in the Severn Trent Water Authority. It consists largely of tables of figure; the figures are also illustrated by pie diagrams and colored maps. (Orr-FIRL)

ORGANIC CONTAMINANTS IN WATER SUPPLIES.
American Water Works Association, New York Committee on Organic Contaminants
Journal of the American Water Works Association, Vol 67, No 8, p 418-424, August, 1975. 5 fig, 3 tab, 12 ref.

Descriptors: *Water treatment, *Organic compounds, *Monitoring, *Pollutant identification, *Analytical techniques, Water analysis, Chemical analysis, Potable water, Water quality control, Gas chromatography, Water supply.
Identifiers: Carbon adsorption method(CAM), High-flow CAM, Low-flow CAM, Organics-carbon adsorbable test, Carbon chloroform extract(CEE), Carbon alcohol extract(CAE).

The findings of the subcommittees of the AWWA Committee on Organic Contaminants in the areas of organic contaminants in water supplies and the status of detection methods are reported. Standard monitoring procedures for organic contaminants involve three variations of the carbon adsorption method (CAM): the high-flow CAM (CAM-hf); the low-flow CAM (CAM-lf); and, the organics-carbon adsorbable (O-CA) test. The following recommendations were offered by the committee. The organic contaminant content of the water should be monitored continuously before and after treatment. The O-CA technique seems to be a promising technique for this monitoring. The historical carbon chloroform extract (CCE) and carbon alcohol extract (CAE) data retrieved from STORET should be subjected to extensive study and statistical evaluation. The concentration and cleanup step in the analysis of trace organics needs to be thoroughly investigated. Available procedures for this step, such as carbon or macromolecular resin adsorption, freeze concentration, and solvent extraction, should be qualitatively and quantitatively evaluated, improved, and possible automated to facilitate wider application. Research should be performed to improve rapid gas chromatography techniques for water quality control. The interfaced gas chromatograph-mass spectrometer-computer system for organic analysis should be further developed. Its application in water treatment should be demonstrated. (Orr-FIRL)

Benzo(a) pyrene.

review and evaluation is presented of the cur-
nt knowledge of particulate polycyclic organic
tter in the environment as related to possible
leterious effects on human health and welfare.
urces, distribution, measurement, and control
hnology are also considered. Results of an ex-
sive literature search are presented. Experi-
nts have shown a number of polycyclic organic
mpounds to be carcinogenic in animals.
though these same compounds have not been
ven to be carcinogenic in humans, evidence
ongly suggests that they may contribute to the
rban factor.' In American males, the urban lung
ncer death rate is about twice the rural rate,
en after adjustment for differences in smoking
bits. Evidence suggests significant differences
tween specific urban areas across the United
ates. The bulk of the available data is in terms of
nzo(a)pyrene; so this compound has been used
an index on particulate polycyclic organic
atter. Average seasonal concentrations of BaP in
e ambient atmosphere range from less than
g/m3 in nonurban areas to a maximum of 50
/m3 in rural areas. (EPA)

A SURVEY OF THE BORON CONTENT OF CERTAIN WATERS OF THE GREATER LON-DON AREA USING A NOVEL ANALYTICAL METHOD,
Anglian Water Authority, Huntingdon (England).
Directorate of Scientific Services.
. J. Matthews.
Water Research, Vol 8, No 12, p 1021-1028,
December, 1974. 1 fig, 7 tab.

Descriptors: *Pollutant identification, Water anal-
ysis, *Boron, *Aquatic environment, *Sewage,
Sewage effluents, *Analytical techniques, Water
quality, Water pollution.
dentifiers: *London area(England).

Natural levels of boron, (As boric acid), in the
aquatic environment have been raised artificially
n certain areas by sewage effluents. Boron is
present in sewage effluent by virtue of the use of
sodium perborate as a whitener is washing pow-
ders. A novel analytical method based on the sol-
vent extraction of ferroin borodisalicylate was
used in a survey of various types of sewage, sewage effluent and natural waters in the London area. The method was satisfactory under all conditions. The data obtained will be useful in water resource planning and indicated that the concentration of boron in a watercourse may be used, under certain conditions, to determine the degree of dilution of sewage effluent in the watercourse. Available from the National Technical Information Service, Springfield, Va 22161 as PB-246 274, $3.25 in paper copy, $2.25 in microfiche. Completion Report, (1975). 12 p, 6 fig, 1 tab, 10 ref. OWRT B-057-RI(1). 14-31-0001-4124.

Descriptors: *Chlorination, Amino acids, Lignins, Chlorine, Organic acids, *Pollutant identification.
Identifiers: *Nucleic acids, Vanillin, Caffeine, RNA, DNA.

The existence of nucleic acids and their derivatives in water has been reported. Unexpectedly large amounts of chlorine are incorporated into the nucleic acids, both RNA and DNA. Chlorine attacks the pyrimidine derivatives of nucleic acid first, then attacks the purine derivatives of nucleic acid destructively to form small fragments. 5-Chlorocytosine and 5-chlorouracil were isolated from the chlorinated RNA. 5-Chlorocytosine but no chlorinated thymine derivatives were isolated from the chlorinated DNA. Lignins were chlorinated with chlorine in water to 17% chlorine content. Vanillin is susceptible to chlorination but caffeine is not.

DISSOLVED OXYGEN DEPLETION IN STATIC BIOASSAY SYSTEMS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. fo Fisheries and Wildlife Sciences.
C. B. Schreck, and P. Brouha.
Bulletin of Environmental contamination and Toxicology, Vol 14, No 2, p 149-152, August 1975, 3 tab, 20 ref.

Descriptors: *Biomass, *Bioassay, *Dissolved oxygen, *Decomposing organic matter, Fish, Water quality, Laboratory tests, Water pollution effects, *Toxicity.
Identifiers: *Bluegill, *Lepomis macrochirus, *Dead fish.

Dead individuals in an aquatic bioassay were found to influence the toxicity of test substances to the remaining living fish within the system. Test results indicated an inverse relationship between dead fish (Bluegill, Lepomis macrochirus) biomass and the dissolved oxygen in the system. The greater the amount of decomposing tissue the more rapid was the decline in oxygen from saturated levels. (Klein)

MERCURY IN FISH IN THE DERWENT ESTUARY, TASMANIA, AND ITS RELATION TO THE POSITION OF THE FISH IN THE FOOD CHAIN,
Commonwealth Scientific and Industrial Research Organization, Hobart Australia. Tasmanian regional.
D. A. Ratkowsky, T. G. Dix, and K. C. Wilson.
Australian Journal of Marine and Freshwater Research, Vol 26, No 2, p 223-232, July 1975. 1 fig, 5 tab, 25 ref.

Descriptors: *Heavy metals, Fish, *Mercury, *Food chains, Sampling, Analytical techniques, Speciation, Estuaries, *Australia, Estuaries, *Pollutant identification.
Identifiers: *Bioaccumulation, *Finfish, *Tissue analysis, Platycephalus bassensis, *Derwent estuary(Tasmania).

Total mercury concentrations were reported for 258 individuals representating 16 species of finfish from the Derwent Estuary, Tasmania. Mercury concentrations in the muscle tissue varied between 0 and 2.0 milligrams/kilogram in one specimen of shark. Irrespective of species, the area containing Ralphs Bay contained a higher precentage of fish with mercury concentrations> 0.5 milligrams/kilogram than any other area of the estuary. The fish's position in the food chain appeared to be an important factor determining its mercury content. 51% of individual fish of species whose diet consisted of other fish had mercury concentrations > 0.5 milligrams/kilogram. In contrast, 24% of invertebrate predators and only 7% of individuals of herbivorous habit and mercury concentrations>0.5 milligrams/kilogram. (Klein)

TRACE METAL LEVELS IN BEACH DIPTERANS AND AMPHIPODS,
Stanford Univ., Pacific Grove, Calif. Hopkins Marine Station.
J. A. Bender.
Bulletin of Environmental Contamination and Toxicology, Vol 14, No 2, p 187-192, August 1975, 4 fig, 9 ref.

Descriptors: *Amphipoda, *Diptera, *Insects, *Metals, Heavy metals, Beaches, Copper, Cadmium, Iron, Zinc, Analytical techniques, Ecosystems, Nickel, Managanese, *Trace elements, Pollutant identification, *California.
Identifiers: *Beach flies, *Beach hoppers, Silver, Bioaccumulation, Coelopa vanduzeei, Fucellia rufitibia, Orchestoidea corniculata, Orchestoidea californiana, Monterey Peninsula(Cal).

Beach hoppers and flies were collected from four points on the Monterey Peninsula, California. The beach flies (Coelopa vanduzeei, Fucellia rufitibia) showed higher levels of Zn, Fe, Cu and Cd than did amphipods (Orchestoidea corniculata, O. californiana). Variations in trace metal levels on one beach over time were plotted. Great Fe flucutuations occurred while manganese, Cd, Ag and Ni showed stable levels. Cu, Pb and Zn showed moderate fluctuations. Differences in feeding habits, absorption, and metabolism between the dipterans and amphipods were discussed with reference to the variations in the metal levels. (Klein)

MERCURY LEVELS IN GEORGIA OTTER, MINK, AND FRESHWATER FISH,
Duke Power Co., Charlotte, N.C. Design Engineering Dept.
P. M. Cumbie.
Bulletin of Environmental Contamination and Toxicology, Vol 14, No 2, p 193-196, August 1975, 2 tab, 10 ref.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Heavy metals, *Toxicity, *Mercury, Fish, *Bass, *Suckers, *Mink, *Otters, Path of pollutants, Environmental effects, Food chains, Fish physiology, Animal physiology, Ecosystems, Pollutant identification, *Georgia, Lethal limit.
Identifiers: *Gar, *Largemouth Bass, *Chain pickerel, *Bowfin, Bioaccumulation, *Chubsucker, *Redfin pickerel, Lutra canadensis, Micropterus salmoides, Esoxniger, Amia calva, Lepisosteus, Esox americanus, Tissue analysis, *Swannee River(Geo).

The presence of mercury in fish of relatively unpolluted Georgia lower Coastal Plain streams resulted in accumulation of mercury by otter (Lutra canadensis) and mink (Mustela vison) which feed on these fish. Mercury concentrations detected in axial muscles of the fish-largemouth bass (Micropterus salmoides), chain pickerel (Esox niger), bowfin (Amia calva), gar (Lepisosteus), chubsucker (Erimyzon obloengus) and Redfin pickerel (Esox americanus), ranged from 0.12-1.40 ppm. The effects of sublethal mercury concentrations on food chains and ecosystems were discussed. (Klein)

IN SITU COLOUR MEASUREMENTS ON THE GREAT LAKES,
Canada Centre for Inland Waters, Burlington(Ontario).
K. P. B. Thomson, and J. Jerome.
Environment Canada, Scientific Series No. 51, 1975. 11 p, 3 fig, 5 tab, 10 ref.

Descriptors: *Color, *Great Lakes, *Analytical techniques, *Optical properties, *Physical properties, Light, Water analysis, Water pollution effects, Water quality, Lake Ontario, Lake Superior, Surface waters, Suspended solids, Turbidity, Suspension, Productivity, Biology, Plant growth, Measurement, On-site investigations, On-site tests, Lakes, Limnology, Sediment load, Algae.
Identifiers: *Color measurements, *Spectral irradiance, *Optical measurements, Biological activity, Tristimulus values, Luminosity, Quanta spectrometer.

Measurements of upwelling and downwelling spectral irradiance have been used to compute in situ color for Lakes Ontario and Superior. The computations of the color were based on the CIE chromaticity system. Tristimulus values for a network of stations and a number of different time periods were analyzed with reference to limnological parameters. The analysis showed that suspended inorganic material and biological activity affect the in situ color in characteristic ways. In effect, three principal water regimes can be identified by their characteristic or dominant wavelength. These are clear water with little dissolved or suspended substances, water that is biologically productive, and water with heavy sediment loading. The in situ color also indicates basic differences between the two lakes that are related to their productivity. (Henley-ISWS)

IN SITU SOIL GAMMA ANALYZER--A NEW APPROACH TO DETERMINE THE MOVEMENT OF POLLUTANTS IN SOILS.
National Environmental Research Center, Las Vegas, Nev.
J. C. McFarlane, K. W. Brown, and R. R. Kinnison
Soil Science, Vol. 120, No. 2, p 140-146, August 1975. 4 fig, 4 ref, 1 append.

Descriptors: *Pollutant identification, *Nuclear meters, *On-site investigations, *Radioactivity, *Soil contamination, Soils, Soil analysis, Evaluation, Soil tests, Instrumentation, Gamma rays, Radiation, Analytical techniques, Radioactivity techniques, Soil chemistry, Trace elements, Path of pollutants, Radioisotopes
Identifiers: *Soil gamma analyzer, *Gamma analyzer, *On-site analyzer, Automatic analysis, Gamma-emitting material.

The in situ soil gamma analyzer is an instrument constructed to measure the position of gamma-emitting trace elements in soil. It consists of a solid state scintillator, a lead shield with a 3-mm-wide horizontal window, and a portable analyzer. When the detector is lowered into a circular excavation dug vertically into the soil of interest, the gamma activity of the tracer is plotted as a function of depth thus yielding a profile of the tracer distribution. Because of a broad base profile in the original plotted data, which is due to soil attenuation and the lack of collimation, a computer program was written to replot the distribution pattern to within + or -1 mm of actual position. By making a series of time-related measurements, the rate of pollutant movement in soil is obtained. (Henley - ISWS)

ODOR INTENSITIES AT CATTLE FEEDLOTS,
Texas Agricultural Extension Service, College Station.
J. M. Sweeten, D. L. Reddell, L. M. Schake, and B. Garner.
Presented at the 1st Annual Symposium on Air Pollution Control in the Southwest, Texas A and M University, College Station, Texas, November 5-7, 1973, 17 p. 3 fig, 7 tab, 29 ref.

Descriptors: *Odor, *Feed lots, *Cattle, Air pollution, Runoff, Farm wastes, Measurement, Weather data, Moisture, Settling basins.
Identifiers: *Scentometer, *Calcium bentonite, Odor intensity index.

Odor intensities measured at two cattle feedlots in Texas, ranged from 2 to 170 dilutions to threshold (DT) which nearly covered the measurement range of the scentometer. The average odor reading for the surface of a 4000 head feedlot, determined by monitoring four randomly selected pens for 7 months, was 30.7 DT. The runoff settling basin and retention pond averaged 68 and 47 DT, respectively. Half of the odor intensities were more than 23 DT (which exceeds the odor standards in several states). At a 12,000 head feedlot, trials using calcium bentonite as a ration supplement (at 0.0, 0.8, and 2.0% levels) showed a reduction in odors from the 2% bentonite treatment. Bentonite also improved average daily gain of cattle during the first 21 days. The scentometer was found to be a useful, if somewhat imprecise, diagnostic tool for identifying the primary sources of odors within a cattle feedlot. (Russell-East Central)

THE EFFECTS OF STREAM CHANNELIZATION OF THE DISTRIBUTION OF NITRIENTS AND METALS,
East Carolina Univ., Greenville, N.C. Dept. of Biology.
C. W. O'Rear, Jr.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-246 193, $4.25 in paper copy, $2.25 in microfiche. North Carolina Water Resources Research Institute, Raleighs. UNC WRRI Report No. 108, August 1975. 52 p, 14 fig, 31 tab, 29 ref, append. OWRT A-080-NC (3), 14-31-0001-4033.

Descriptors: *Channel Improvement, *Nutrients, Phosphorus, Nitrogen, Swamps, Chemical analysis, Chemical precipitation, *Metals, Aquatic plants, Water temperature, Oxygen, Sediment, *Water quality, *North Carolina, *Path of pollutants, *Distribution patterns, Dissolved solids, Dissolved oxygen.
Identifiers: *Channelization, Swift Creek(NC), Nutrient concentrations, Chicod Creek(NC), Ammonia-nitrogen.

The project was designed to determine the distribution patterns of nutrients and metals in channelized and unchannelized stream segments and to determine if modifications occur in the distribution of nutrients. Adjacent segments of Swift Creek, Pitt County, North Carolina were used as the sites. An upstream segment channelized in 1937 was used as a representative natural stream while a segment approximately one kilometer downstream, channelized in 1965, was used as a representative channelized stream. Sampling was performed from September, 1973, through November, 1974. Water temperature in the natural segment tended to be lower than in the channelized segment due to a greater canopy cover in the natural segment. Dissolved oxygen in the channelized segment was consistently higher during low flow periods with average differences exceeding 2 mg/l. Most of the nitrogen and phosphorus moved through both stream segments during the high flow periods. The highest concentrations were observed during the low flow period of October through December. Ammonia-N accounted for most of the increased nitrogen concentrations while particulate phosphorus accounted for the rise in total phosphorus. Nutrient concentrations in Chicod Creek were lower than the unchannelized segment of Swift Creek. Modification of the nutrient distribution patterns could not be directly determined from the measured nutrient concentrations and flows. Dissolved metal concentrations between the two segments showed no significant differences. (Stewart-North Carolina State)

Descriptors: *Farm wastes, *Agricultural runoff, *Soil contamination, *Ammonia, *Nitrogen, *Water pollution, *Water quality, *Experimental models, Movement, *Wisconsin, *Path of pollutants.

nodel was developed to predict transformations l vertical movement of manurial nitrogen ough unsaturated soil profiles following early ing manure application. Processes treated in the del include water movement in unsaturated l, nitrate dispersion due to mass flow and the rogen transformations of mineralization and rification. Output from the model includes the tical nitrate distribution in the soil and the ount of nitrate leaching from the soil profiles. e pollution potential of snowmelt from areas ead with manure was investigated. Urinal and al wastes were placed in runoff boxes at the e, midpoint and top of 20cm snow packs. The ts were subjected to carefully controlled tem- rature fluctuations ranging from 8 to 12 degrees Urinal losses were determined primarily by the antity of water which passed through the nure layer. Fecal nitrogen losses were much ver than urinal losses. Freezing and thawing ac- ns were important factors which influenced the al nitrogen losses. Runoff and nutrient losses m ten alfalfa plots were monitored for a 3-year riod. Dairy cattle manure was applied in the fall, nter and spring at the rate of 2.25 g/square mile et weight basis). Annual precipitation for the 3- ar period ranged from 105.4 to 108.3 cm with ap- oximately 12% (Water equivalent) in the form of ow. The average annual runoff from the check, l, winter and spring applied manure plots was 6, 7.3, 10.4 and 10.6 cm, respectively. No sig- icant differences were observed in the nutrient sses from the various treatments.

vailable from the National Technical Informa- n Service, Springfield, Va 22161, as AD/A-000 5, $7.25 in paper copy, $2.25 in microfiche. rmy Waterways Experiment Station, Vicksburg, ississippi, Environmental Effects Laboratory. ptember, 1974. 134 p, 24 fig, 15 tab, 108 ref, 3 pend.

escriptors: *Waste disposal, *Environmental ef- cts, Land use, Land management, On-site in- stigations, Public rights, Dikes, Wetlands.
entifiers: Land application, Dredged material.

ur on-site investigations at the United States rmy Engineering District areas of Mobile, Port- nd, Norfolk, and Detroit were conducted to udy objectionable conditions associated with nfined disposal of dredged material. Problems volve: conditions associated with disposal area effectiveness, such as dike failures; conditions sociated with biological, chemical, or physical anges caused by the disposal area; and issues as- ciated with site selection such as ecological ef- cts and changes in land management and use. blic attitudes toward confined disposal appear be related to past experiences. Current chnology is able to deal with the prevention of ke failure, seepage, channelization, and dike osion, but is not able to solve the problem of anding water in disposal areas. Ecological issues ve been centered upon the wetlands as disposal tes and the ultimate use and control of such eas. It was suggested that alternative disposal ocedures be implemented, asuch as pumping in- nd, to avoid disruption of ecologically-sensitive etland areas. (Kramer-FIRL)
76-00516

GROUND WATER POLLUTION FROM SUB-SURFACE EXCAVATIONS: PART V, OTHER TYPES OF WELLS.
Environmental Protection Agency, Washington, D.C.
Water Well Journal, Vol 28, No 8, p 59-62, August, 1974.

Descriptors: *Water pollution, *Well, Disposal wells, Sewage disposal, Desalination, Underground storage, Geothermal studies, Regulation, Excavation.
Identifiers: Prevention.

Other wells include types used in conjunction with oil exploration and production, solution mining, geothermal energy production, sewage treatment, desalinization, radioactive waste disposal, underground gas storage and water exploration and production. Many of the technical and regulatory aspects previously described in part IV of this study apply to these wells. (See also W74-09929) The differences are discussed. For example, gas storage wells present a potential for contamination of ground water by leakage of gas through the confining beds, through abandoned improperly plugged wells, or through inadequately constructed gas injection or withdrawal wells. Gas could also escape from an overpressured field and migrate laterally in the storage aquifer. (Bradbeer-NWWA)
W76-00525

GROUND WATER POLLUTION FROM SUB-SURFACE EXCAVATIONS. PART IX, LAND-FILLS.
Environmental Protection Agency, Washington, D.C.
Water Well Journal, Vol 28, No 12, p 41-44, December, 1974.

Descriptors: *Landfills, *Water pollution sources, Garbage dumps,, Public health, Solid wastes, Leaching, Subsurface drainage, Soil contamination, Monitoring, Waste disposal, Excavation.
Identifiers: Pollution monitoring.

A sanitary landfill is: 'A method of disposal of refuse on land without creating nuisances or hazards to public health or safety, by utilizing the principles of engineering to confine the refuse to the smallest practical area, to reduce it to the smallest practical volume, and to cover it with a layer of earth at the conclusion of each day's operation or at such more frequent intervals as it may be necessary.' Less than 10 percent of the refuse disposal sites in the United States are operated within the accepted definition of a sanitary landfill. The potential hazard of landfills to ground water quality via leachate is a function of the total amount of waste generated, its areal distribution, the composition of the waste itself, and the siting, design, and operation of the fill. Leaching of landfills depends upon a source of water moving through the fill. Possible sources include precipitation, moisture content of the refuse, and ground water in contact with the fill. Effects of climate on leachate are discussed. A long list of control measures is given. These are in general those which exclude water from the landfill, prevent leachate from percolating to ground water, or collect leachate and subject it to biological treatment. Monitoring procedures are suggested including sampling wells around the site. (Bradbeer-NWWA)
W76-00526

GROUND WATER POLLUTION FROM SUB-SURFACE EXCAVATIONS, PART X, SEWER LEAKAGE.
Environmental Protection Agency, Washington, D.C.
Water Well Journal, Vol 24, No 1, p 92-95, January, 1975.

Descriptors: *Sewers, *Water pollution, Drainage systems, Subsurface drainage, Water quality control, Leakage, Design, Monitoring, Maintenance, Excavation.
Identifiers: *Influent, Pollution monitoring.

Gravity sewers above the ground water table, and pressure outfalls either above or below it, are common elements of the domestic sewerage system of organized communities. Seasonally, storm sewers involving underground conduits and lined and unlined open channels carry runoff from paved and unpaved land surfaces. A sewer is intended to be water-tight and thus to present no hazard to ground water except when temporarily disrupted by accident. Leakage is in reality a common occurrence, especially from older sewers. Leakage in gravity sewers may result from poor workmanship, cracked or defective pipe sections, breakage of pipe and joining material by tree roots, displacement of pipeline by superimposed heavy loads, rupture due to landslide activity or seismic activity, loss of support due to underground washout, differential settlement, and storm water infiltration surcharging the system causing sewage to back up. Sewer leakage will be less of a hazard to ground water in the future than at present, even though the extent of the systems is certain to increase to accommodate growth. The principal reasons are improved construction and maintenance practices. Control methods include a public policy of maximum concern for water quality protection, organized and identified responsibility for sewer construction and maintenance, a program of inspection at five year intervals, emphasis on personnel training, and exclusion from discharge to public systems of irretrievably hazardous materials. (Bradbeer-NWWA)
W76-00527

GROUNDWATER POLLUTION FROM SUB-SURFACE EXCAVATIONS, PART XI, TANK AND PIPELINE LEAKAGE.
Environmental Protection Agency, Washington, D.C.
Water Well Journal, Vol 24, No 2, p 37-41, February, 1975.

Descriptors: *Water pollution, *Groundwater, *Detection, *Control, *Monitoring, *Path of pollutants, Pipelines, Underground, Storage tanks, Radioactive wastes, Petroleum, Excavation.
Identifiers: Tanks, Underground pipeline.

The nature and occurrence of tank and pipeline leakage are described and practices that have been found effective in the control and abatement of ground water pollution are summarized. Emphasis is on petroleum products because they constitute the majority of materials stored or transmitted in subsurface excavation. Leakage of these may be more pervasive than generally realized. This is particularly true for a small installation where installation, inspection, and maintenance standards may be low. The major cause of leakage is corrosion, which attacks both externally and internally. The second greatest cause can be found by aggregating those related to pipeline component, equipment, personnel failure or malfunction. The third greatest cause is line rupture as the result of accidents caused by earth moving equipment. The remaining causes include vandalism, severe weather, lightning. floods, earthquakes and forest fires. Pollution movement is traced. Control methods include leak prevention by protection against corrosion and structural design, containment of leaks (Almost exclusively applied to tanks), or automatic shut-off valves and abatement by removal of soil, by pumping or ditching, by biodegradation, and by chemical action. Monitoring procedures have been developed and implemented by interstate carriers, but may be applied to any underground tank or pipeline. Regular checking of pipeline and tanks is accomplished by throughput monitoring, periodic inspection, and periodic pressure testing. (Bradbeer-NWWA)

FATE OF TRACE METALS IN LOS ANGELES COUNTY WASTEWATER DISCHARGE,
Massachusetts Inst. of Tech., Cambridge. Dept of Civil Engineering; and Massachusets Inst. of Tech., Cambridge. Ralph M. Parsons Lab. for Water Resources and Hydrodynamics.
F. M. M. Morel, J. C. Westall, C. R. O'Melia, and J. J. Morgan.
Environmental Science and Technology, Vol 9, No 8, p 757-761, August 1975. 4 fig, 3 tab, 14 ref.

Descriptors: *Trace elements, *Waste dilution, *Metals, *Sewage effluents, *Waste disposal, *Water chemistry, *California, Water analysis, Chemical properties, Disposal, Drainage water, Chemistry, Domestic wastes, Industrial wastes, Outfall sewers, Inorganic compounds, Sewage treatment, Water pollution sources, Water pollution, Sea water, Estuarine environment, Pollutants, Sediments, Equilibrium, Model studies, Speciation, Heavy metals.
Identifiers: *Los Angeles County(Calif).

A chemical equilibrium model of Los Angeles County sewage outfall was presented which accounts for the chemical speciation of trace metals. Many metals were found in very insoluble sulfide (Zn, Hg, Ag, Cu, Cd, Pb) or oxide (Cr, Fe) forms, while some (Ni, Co, Mn) were relatively soluble. A study of the oxidation and dilution of the sewage by seawater demonstrated that most metals tend to be solubilized upon disposal in the ocean and that unmeasurable increments in the natural metal concentrations should result away from the outfall. It was argued that the sewage particulate is not mobilized in the vicinity of the outfall and that the nearby sediments are a mixture of naturally-occurring sediments and sewage particulate. About 0.5% of the sewage particulate--and its metal content--can be accounted for in the reduced area. (Henley-ISWS)

THE USE OF A PELAGIC TROPHODYNAMIC CHAIN FOR STUDYING THE TRANSFER OF METALLIC POLLUTANTS, (IN FRENCH),
Centre dEtudes et de Recherches de Biologie et d'Oceanographie Medicale, Nice (France).
M. Aubert, R. Bittel, F. Laumond, M. Romeo, and B. Donnier.
Rev Int Oceanogr Med. 283 p 27-52, 1972. Illus. (Engl. summ.).

Descriptors: *Seawater, Source of pollutants, Metals, *Pollutants, *Heavy metals, Copper, Zinc, Chromium, Lead, Mercury, *Water pollution.
Identifiers: Pelagic trophodynamic food chain.

Discharges of metallic products in a simple or complexed form into seawater become more and more important. It is necessary to assess the hazards of contamination for man by consumption of marine products. The use of marine food chains permits 'in vitro study of these concentration phenomena. The factors of transfer of different metals may be measured at each level of the pelagic food chain. The transfer of 5 heavy metals Cu, Zn, Cr, Pb and Hg was studied in an ionic or complexed form.--Copyright 1974, Biological Abstracts, Inc.

A PROBLEM IN THE USE OF INSECTICIDES IN PADDY FIELDS IN WEST MALAYSIA: A CASE STUDY,
Ministry of Agriculture and Lands, Kuala Lumpur (Malaysia). Div. of Agriculture.
Ahmad Yunus, and Lim Guan Soon.
Malays Agric J. Vol 48, No 2: p 167-183. 1971 Illus.

Descriptors: *Insecticides, Water pollution, *Fish toxins, Fish, *Water pollution sources, *Water pollution effects, Dieldrin, Endrin.
Identifiers: Azinophos, BHC, Carbaryl, Endosulfan, Ethyl, Fenitrothion, Fenthion, Malathion, Malaysia, Paddy fields.

A field survey to determine the problem of fish toxicity arising from the use of insecticides in paddy fields was carried out in 2 of the major paddy growing areas, Province Wellesley in the State of Penang and Krian District in the State of Perak in Jan- Apr., 1970. Ninety percent of the farmers used insecticides to control insect pests on their crops. Insecticides commonly used were endosulfan, carbaryl and BHC. In general, spot application was more popularly practices than blanket and prophylatic treatments. Hence the quantity of insecticide used per crop was relatively small. Among the above chemicals, only endosulfan caused acute toxicity to paddy field fishes. However, killing of the fishes by BHC, azinophos-ethyl, dieldrin and endrin was observed in Krian, due to the higher rates of application employed. No fish mortality was observed in the connecting ponds and irrigation canals adjacent to paddy fields. Paddy field fishes provided additional income to 35% of the farmers surveyed. Apart from the income, the fishes also served as the main daily source of protein in their food. The use of endosulfan which is effective in controlling stem borers, should be avoided in areas where fishes are considered important and BHC (applied at not more than 2 lb. a. i./acre) could be used in its place. Insecticides such as dieldrin, endrin and azinophos-ethyl which show strong piscicidal effect should also be avoided in such areas. The use of malathion, carbaryl, fenitrothion and fenthion can be continued. There is a need to extend the survey to other paddy growing areas.--Copyright (c) 1974, Biological Abstracts, Inc.

PREDICTION OF ASSIMILATION CAPACITY IN RECEIVING STREAMS, PART I,
Oklahoma State Univ., Stillwater. Dept. of Civil Engineering.
A. F. Gaudy, Jr.
Water and Sewage Works, Vol 122, No 5, p 62-65, May, 1975. 3 fig.

Descriptors: *Waste assimilative capacity, *Dissolved oxygen, Biochemical oxygen demand, Oxygen sag, Oxygenation, Waste water disposal, Analytical techniques, Rivers, Measurement, *Forecasting.

The practical method described for predicting the dissolved oxygen profile has been used for studying the assimilation capacity of a portion of the Red River in Oklahoma. This method overcomes some of the problems associated with the use of the Streeter-Phelps say equation which have led to a lack of accurate prediction. The Streeter and Phelps concept states that the dissolved oxygen profile is the result of deoxygenation due to introduction of organic pollutants, and reoxygenation due to mass transfer of oxygen from the atmosphere. The integrated form of a mathematical expression of this concept is known as the 'sag equation'. A better expression for the sag equation would be to describe it as a function of reaeration minus oxygen uptake. A rationale for this description is presented. The only BOD curve that can be expected to hold true for the receiving stream situation is one obtained by using the same dilution as that expected in the receiving stream. This is not always possible using the normal closed bottle BOD dilution technique. A stirred open jar reactor system is proposed as an improved practical method for estimating BOD curves rather than the standard closed bottle technique. The first step is to add the effluent and the receiving stream water in the desired proportion and aerate the system to bring the DO level close to the saturation concentration. A portion of acclimated seed is then added to the river water. After initiating the experiment, the dissolved oxygen profile is determined electrometrically. (See also W76-00601) (Orr-FIRL)

PREDICTION OF ASSIMILATION CAPACI IN REC EIVING STREAMS, PART II,
Oklahoma State Univ., Stillwater. Dept. of C Engineering.
A. F. Gaudy, Jr.
Water and Sewage Works, Vol 122, No 6, p 78 June, 1975. 2 tab, 17 ref.

Descriptors: *Waste assimilative capaci *Forecasting, *Dissolved oxygen, Streams, O ygen demand, Biochemical oxygen deman Analytical techniques, Waste water disposal Identifiers: Effluent discharges, Oxygen upta curve.

A procedure for predicting the dissolved oxyg profile from the calculated oxygen uptake curve streams receiving effluent discharges is outlin The procedure has been used to determine the similation capacity of part of the Red River Oklahoma. The dissolved oxygen saturation val and the reaeration constant K2 are calculate deficit is computed, multiplied by the K2 valu and recorded. The time interval and the avera values during the time interval are taken. Fro this, the change in dissolved oxygen (DO) conce tration may be computed as the oxygen upta during a particular interval. By repeated calcul tions, a representative average accumulated o ygen uptake curve (BOD curve) may be made f the effluent-river water mixture. From this curv the dissolved oxygen profile may be computed. this case, oxygen uptake for BOD values was re off at even hour intervals. After accounting for t amount of deficit from saturation, the amount oxygen added during each time interval was o tained by multiplying the reaeration constant (K by the deficit value and delta time. Calculatio are easily computer programmed. In many recei ing stream situations, K2 does not remain consta and must be adjusted for each successiv downstream reach. For open jar reacto techniques, it is suggested that preliminary an training runs be used. While this method is st under investigation, it has been successfully use to make an engineering prediction of the impact o an effluent on the DO of a resource. (See als W76-00600) (Kramer-FIRL)

ISTRIBUTION OF RADIONUCLIDES IN THE OLUMBIA RIVER STREAMBED, HANFORD ESERVATION TO LONGVIEW, WASHING-ON,
eological Survey, Reston, Va.
. L. Haushild, G. R. Dempster, Jr., and H. H. tevens, Jr.
vailable from Supt of Docuements, GPO, Wash, C, 20402, price $1.20. Professional Paper 433-O, 975. 35 p, 12 fig, 11 tab, 21 ref.

escriptors: *Path of pollutants, *Nuclear wastes, Columbia River, *Washington, *Nuclear reacors, Carriers, Radiosotopes, Sediments, Sediment transport, Particle size, Distribution patterns, Streambeds, Bottom sediments, Streamow, Data collections.
dentifiers: *Hanford Reservation(Wash).

Until all the eight reactors at Hanford Reservation, Washington, cooled by once-through flow of treated Columbia River water, were shut down in 1971, their cooling-water effluent was the main source of dissolved and particulate radionuclides in the Columbia River. The distribution and quantities of radionuclides accumulated in the riverbed were investigated. Chromium-51 and scandium-46 usually had a greater affinity for fixation to fine sediment, relative to coarse sediment, than did zinc-65 or cobalt-60. Radionuclide concentrations in both coarse sediment and fine sediment did not vary significantly (95 percent confidence level) within relatively long river reaches. In June 1965, 28,900 curies of radionuclides were estimated to be in the Columbia River streambed from the reactors to the ocean: 20,200 curies in the riverbed, and 8,700 curies in the estuary bed (Hubbell and Glen, 1973). A predominance of chromium-51 over zinc-65 in the estuary bed and an opposite predominance in the riverbed indicate less seasonal variation in the accumulation of radionuclides (epecially chromium-51) in the estuary bed than in the riverbed. FLOW ESTABLISHMENT AND INITIAL ENTRAINMENT OF HEATED WATER SURFACE JETS,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
H. Stefan, L. Bergstedt, and E. Mrosla.
Available from the National Technical Information Service Springfield, Va 22161 as PB-243-744. Environmental Protection Agency Report EPA-660/3-75-014, May 1975. 141 p, 36 fig, 5 tab, 15 ref, 2 append. R-800-435.

Descriptors: *Mathematical models, Outlets, Flow rates, *Thermal pollution, Discharge(Water), Water quality, Water quality control, Water pollution, Water pollution control, Experimental data, Flow, Mixing zone, Dilution, Heated water, *Jets, Path of pollutants.
Identifiers: *Thermal plumes, Surface discharge, Heated water jet, Jet flow, Buoyant jets, Zone of flow.

Mathematical modeling of the zone of flow (re-)establishment (ZFE) of heated water surface jets has been found to be difficult because of the complex dependence on outlet geomtry, discharge velocity, buoyancy, and ambient currents. Laboratory experiments have therefore been conducted to provide more observations and data on flow patterns, temperatures, and flow velocities in the ZFE and some distance beyond. From this information, relationships giving the length of the ZFE, the volumetric flow rates versus distance, and the initial spreading angle have been derived. The independent variables were outlet aspect ratio, outlet densimetric Froude number, and cross-flow ratio. The relationships provided can be used to make more accurate temperature predictions in the immediate vicinity of a heated water surface channel. (EPA)

CONTRIBUTIONS OF URBAN ROADWAY USAGE TO WATER POLLUTION,
Biospherics Inc., Rockville, Md.
D. G. Shaheen.
Available from the National Technical Information Service Springfield, Va 22161. Environmental Protection Agency, Report EPA-600/2-75-004, March 1975. 346 p, 20 fig, 28 tab, 17 ref, 10 append. 1BB034 Roap/Task 21 ASY 05. EPA 68-01-0197.

Descriptors: *Water pollution sources, *Storm runoff, Surface runoff, *Urban runoff, Nutrients, *Heavy metals, *Asbestos, *Rubber, Solid wastes, District of Columbia, Roads.
Identifiers: Inorganic wastes, *Street surface contaminants, Grease, Washington, D. C.

Street surface contaminants are deposited on roadways from many sources within an urban area. Industrial operations, land use activities, fallout of air pollutants, roadway usage and other activities contribute to the loading of particulates on urban roadways. These materials are then carried into receiving waters by storm runoff where they constitute a substantial portion of the overall water pollution problems of cities. Metropolitan Washington, D.C., with its low background of industrial emissions, was the area chosen for study of contributions of motor vehicle usage to urban roadway loading factors. Specific roadway study sites within this area were selected so as to provide minimal interference from nontraffic-related land use activities and thus isolate, as much as possible, the traffic-related depositions. Motor vehicular traffic is directly or indirectly responsible for deposition of substantial quantities of materials on roadways in urban areas. Significant levels of toxic heavy metals and asbestos and slowly biodegradable petroleum products and rubber are deposited directly from motor vehicle along with large quantities of particulate materials contributed indirectly by traffic. The particulates contribute indirectly by traffic are largely inorganic, but have associated with them solids and nutrients which represent a serious source of water pollutants in all metropolitan areas. TCA IN IRRIGATION WATER AFTER BANK TREATMENTS FOR WEED CONTROL,
Agricultural Research Service, Prosser, Wash. Irrigated Agriculture Research and Extension Center.
R. D. Comes, P. A. Frank, and R. J. Demint
Weed Science, Vol 23, No 3, p 207-210, May, 1975. 3 tab, 9 ref.

Descriptors: *Herbicides, *Weed control, *Irrigation water, *Water pollution, Plant growth regulators, Irrigation ditches, Embankments, Irrigated land, Bank protection, Water pollution sources, Defoliants, Agricultural chemicals, Water analysis, Water quality, Chemical analysis, Irrigation, *Pollutant identification.
Identifiers: *Trichloroacetic acid(TCA).

Concentrations of trichloroacetic acid (TCA) were determined in irrigation water after the herbicide had been applied to the banks of dry canals at 82 kilograms/hectare for weed control. When the canals were refilled about 5 months after treatment, maximum concentrations of TCA detected in the water ranged from 53 to 297 parts per billion (ppb). The concentration was highest during the first hour of water flow with maximum concentration increasing at a rate of 26 to 30 ppb/kilometer of treated canal flow, unless surface runoff or reduced flow volumes caused abnormal canal flows. With one exception, no TCA was detected in the water after 4 hours of flow. In the 6 experiments conducted, the highest average concentration of TCA during the first 240 minutes of water flow was 50 ppb. Calculations show that only 2.4 cm of water could be applied in the initial 240 minute period and that if the highest average concentration were used as a base value, only 12g of TCA would be applied by the water to 1 hectare of cropland. FIELD STUDY OF SOLUTE MOVEMENT IN A HIGHLY AGGREGATED OXISOL WITH INTERMITTENT FLOODING: II. PICLORAM,
Hawaii Univ., Honolulu, Dept. of Agronomy and Soil Science.
P. S. C. Rao, R. E. Green, V. Balasubramanian, and Y. Kanehiro.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Journal of Environmental Quality, Vol 3, No 3, p 197-202, July-September, 1974. 2 fig, 1 tab, 16 ref.

Descriptors: *Pesticides, *Herbicides, Soil chemistry, Water quality, Groundwater, Irrigation, Soil profiles, *Path of pollutants, Water pollution sources.
Identifiers: *Picloram.

Most of the applied herbicide picloram was retained in the top 40-cm depth of the Molokai soil with cumulative applications of 48 to 74 cm water following application of the chemical to the soil surface. Although movement of the picloram peak was retarded more than was anticipated from equilibrium adsorption measurements, a significant fraction of the applied herbicide moved ahead of the peak deep into the profile (down to the 143-cm depth) after a single application of 24-cm water. Rapid flow through macropore sequences combined with temporary retention of picloram in aggregate micropores appear to be responsible for the unusual pattern of movement. Published data for nitrate movement in the same field plots of Molokai soil were compared with picloram movement data to provide a measure of the relative mobility of these solutes. A comparison of the results reported here with published field data of solute leaching in other soils indicated a greater retardation of solute peak movement in Molokai soil than in less aggregated soils. DIFFERING SENSITIVITY OF CORN AND SOYBEAN PHOTOSYNTHESIS AND TRANSPIRATION TO LEAD CONTAMINATION,
Illinois Univ., at Urbana-Champaign.
F. A. Bazzaz, G. L. Rolfe, and P. Windle.
Journal of Environmental Quality, Vol 3, No 2, p 156-158, April-June, 1974. 3 fig, 15 ref.

Descriptors: *Heavy metals, *Crop response, *Lead, *Corn(Field), *Soybean, Photosystems, Transpiration.

Corn and Soybean plants grown in media containing a range of Pb concentrations supplied as PbCl (2), showed decreased net photosynthesis and transpiration with increasing Pb treatment levels. At lower Pb treatment levels, corn appears to be more sensitive than soybeans. However, at high treatment levels (62.5-250 mg/plant) soybeans are more sensitive than corn. At 250 mg Pb/plant in the medium, photosynthesis is only 10% of maximum in soybeans but 47% in corn, even though corn Pb tissue content is much higher than that of soybeans. Transpiration exhibited similar trends to photosynthesis suggesting that, especially in corn, an appreciable part of the inhibition of the two processes is related to increased stomatal resistances with increased Pb concentrations. Lead accumulation trends were similar at treatment levels of 0 to 62.5 mg/plant but were slightly different at higher levels. The total amount of Pb accumulated was higher in corn than in soybeans. Maximum accumulation in both species occurred at 62.5 mg Pb/plant. (Skogerboe-Colorado State)

COLUMN STUDIES OF SOIL CLOGGING IN A SLOWLY PERMEABLE SOIL AS A FUNCTION OF EFFLUENT QUALITY,
Wisconsin Univ., Madison Dept. of Soil Science.
T. C. Daniel, and J. Bouma.
Journal of Environmental Quality, Vol 3, No 4, p 321-326, October-December, 1974. 8 fig, 2 tab, 25 ref.

Descriptors: *Septic tanks, *Soil disposal fields, *Clogging, *Effluents, Chemical oxygen demand, Biochemical oxygen demand, Soil properties, Soil investigations, Soil structure, Soil water movement, Loam.

Clogging as a function of effluent quality was investigated in cores of the very slowly permeable Almena silt loam soil which offers problems for conventional on-site liquid waste disposal. Undisturbed 60 cm long cores were subjected for approximately 120 days to constant ponding with simulated septic tank effluent, extended aeration effluent and distilled water. Column influents and effluents were monitored with respect to chemical oxygen demand (COD), biochemical oxygen demand (BOD), and solid residue fractions. Column influents differed markedly in COD and BOD content but column effluents had consistently low contents indicating the high renovative capacity of the soil. In situ tensiometric, redox, and flow rate measurements indicated development of the most severe barriers to flow in columns ponded with low BOD aerated effluent, followed closely by those ponded with high BOD septic tank effluent. PLANT NUTRIENT LOSSES FROM TILE-OUTLET TERRACES,
Iowa State Univ., Ames. Dept. of Agronomy.
J. J. Hanway, and J. M. Laflen.
Journal of Environmental Quality, Vol 3, No 4, p 351-356, October-December, 1974. 3 fig, 4 tab, 13 ref.

Descriptors: *Nutrient removal, *Nutrients, *Phosphorus, Tile drainage, Sediment, Nitrogen, Nitrification, Sulfur, Runoff, Fertilizer, Fertilization, Tile drains.

Plant nutrient losses in runoff water from four tile-outlet terrace systems in Iowa and in tile drainage from two of the systems were measured annually from April to November over a 3-year period. Soluble P concentrations in surface runoff were related to available P in the surface soils, and concentrations in tile drainage were related to available P in the subsoils. Concentrations of inorganic N varied widely among locations, but were relatively constant at a location. Average annual inorganic N concentrations in surface runoff were 4 ppm or less at three of the four sites and 11 ppm at one site. Concentrations of inorganic N and sulfate S were similar and were lower in surface runoff than in tile drainage. There was no relation between the amounts of fertilizer applied and plant nutrient losses or concentrations in runoff or drainage water. (Skogerboe-Colorado State)
W76-00723

NITRATE AND CHLORIDE LEACHING IN A SWELLING CLAY SOIL,
Agricultural Research Service, Temple, Tex. Blackland Conservation Research Center.
D. E. Kissel, J. T. Ritchie, and E. Burnett.
Journal of Environmental Quality, Vol 3, No 4, p 401-404, October-December, 1974. 4 fig, 3 tab, 9 ref.

Descriptors: *Nitrates, *Chlorides, *Leaching, *Nutrient removal, Soil investigations, Water quality, Lysimeter, Drainage water, Groundwater, Soil water movement.
Identifiers: Nitrate-nitrogen.

Leaching losses of applied NO (3) -N and C1 (-) from a swelling clay soil were measured using an undisturbed field drainage lysimeter. Nitrate-N and C1 (-), applied at 110 and 279 kg/ha, respectively, were detected in drainage water collected at a depth of 125 cm after the first large rainstorm. Applied fertilizer was leached when percolating rainwater carried the applied materials through large connected pores, bypassing other soil water inside soil structural units. Even though applied fertilizer began to be lost with the first rainstorm, concentrations of NO (3) -N and c1 (-) were not high until large amounts of water had drained below the root zone. Much more native soil nitrate was leached than soil nitrate concentrations in unfertilized plots would have indicated. The data indicate that leaching losses of nitrate ... mineralization may be greater than those o... plied nitrate when accumulated drainage is ... mm following fertilizer application (Skoge... AN AUTOMATIC PUMPING SAMPLER F... EVALUATING THE TRANSPORT OF PES... CIDES IN SUSPENDED SEDIMENT,
J. F. Parr, G. H. Willis, L. L. McDowell, C. E. ... Murphree, and S. Smith.

urnal of Environmental Quality, Vol 3, No 3, p 2-294, July-September, 1974. 1 fig, 3 tab, 7 ref.

scriptors: *Pesticides, *Sampling, Sediments, spended solids, Laboratory tests, Equipment, ater quality, Water pollution sources, Path of llutants.

boratory tests were conducted to evaluate the lity of an automatic pumping sampler for as- sing the transport and concentration of pesti- es in suspended sediment. Pesticide-sediment- ter mixtures were formulated with pesticide- iment ratios ranging from 1:15,000 to 1:500. ter stirring periods of 10 and 60 min, these for- lations were pumped through the sampler and quots collected for pesticide analysis. Recovery DDT, trifluralin, toxaphene, and mirex ex- eded 90%, based on their concentrations im- diately prior to pumping. Adsorption of pesti- es to the various plastic, rubber, and fiberglass mpler components was minimized by the high w velocity and rapid delivery systems which en- ed a short time of contact (Seconds) between sample and internal surfaces. These tests in- ate that the sampler is suitable for use in aluating the transport of relatively water-insolu- pesticides in suspended sediment. (Skogerboe- lorado State)

ECIPITATION NITROGEN CONTRIBUTION CLATIVE TO SURFACE RUNOFF SCHARGES,
partment of Agriculture, Lincoln, Nebr.
E. Schuman, and R. E. Burwell.
urnal of Environmental Quality, Vol 3, No 4, p 5-369, Ocotber-December, 1974. 1 fig, 4 tab, 12 .

scriptors: *Nitrates, *Ammonia, Runoff, atershed management, Water quality, Nitrogen, ecipitation, Water pollution sources, Nutrient moval, *Path of pollutants.

mmonia and nitrate concentrations in precipita- n and surface runoff from two adjacent tersheds, fertilized at 168 and 448 kg N/ha, spectively, were studied to determine the rela- e contributions of precipitation N in relation to rface runoff N discharge. The data show that % of the N discharged by surface runoff from sampled events could be accounted for by ecipitation-originated N on the watershed fertil- d at 168 kg N/ha, whereas 53% of the N scharged from the watershed fertilized at 448 kg ha could be attributed to N originating in the ecipitation. However, the data indicate that, on annual basis, the surface runoff N discharge ac- unts for only 20% of that in the total incoming ecipitation. This difference can be accounted for precipitation intensity or duration that did not use runoff, absorption of NH (4) -N by the soil terial, or leaching of NO (3) -N into the soil ofile. (Skogerboe-Colorado State)

SIMULATION MODEL FOR PREDICTION F HERBICIDE PERSISTENCE,
tional Vegetable Research Station, Wel- bourne (England).
Walker.
urnal of Environmental Quality, Vol 3, No 4, p 6-401, Ocotber-December, 1974. 5 fig, 1 tab, 10 .

scriptors: *Simulation analysis, *Model stu- es, *Herbicides, Computer models, Soil in- stigation, Meteorological data, Water pollution urces, Path of pollutants.

simulation model for prediction of herbicide rsistence in the field is described. The model mbines the effects of soil temperature and soil isture content on the rates of herbidice loss, termined experimentally under controlled conditions, with the flucturations in surface soil temperature and moisture content in the field. The computer program includes methods of simulating surface soil temperatures and moisture contents from standard meteorological data. When data were used in the simulation model in conjunction with the relevant meteorological information, the patterns of loss of napropamide incorporated 2 to 3 cm in the field could be predicted. Napropamide was lost rapidly when applied to the soil surface, and since the model only takes into account losses through microbial or chemical metabolism, this could not be simulated. Some of the limitations and the potential benefit of the simulation technique for prediction of pesticide persistence are discussed. (Skogerboe-Colorado State)

Descriptors: *Nitrates, *Denitrification, Soil chemistry, Irrigation, Sprinkler, Irrigation, Irrigation effects, Soil profiles, Water pollution control, Path of pollutants.
Identifiers: *Israel.

Large amounts of nitrates are accumulating in the Hula Valley soils and then subsequently being leached to the Sea of Galilee. The nitrate concentration in the soil has been significantly reduced by induced denitrification. Reducing conditions have been achieved by controlled sprinkling of previously dried soil. BIODEGRADATION OF AQUATIC POLLUTANTS,
Rhode Island Univ., Kingston. Dept. of Microbiology.
C. W. Houston.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-246 273, $3.75 in paper copy, $2.25 in microfiche. Completion Report, (1975). 36 p, 11 fig, 9 tab, 7 ref. OWRT A-050-RI(1). 14-31-0001-5040.

Descriptors: Pesticides, *Biodegradation, *Metabolism, *Herbicides, Pseudomonas, 2-4-D, 2-4-5-T, Organic pesticides, Organic acids, *Pesticide residues, *Pollutant identification.
Identifiers: Co-metabolism.

Organisms isolated from commercial turf farm soil and identified as species of the genus, Pseudomonas, were used to study the utilization of three phenoxy herbicides. 2,4-dichlorophenoxyacetic acid (2,4-D) was readily attacked in a mineral salts medium. 2,4,5-trichlorophenoxyacetic acid (2,4,5-T) and 2-(2,4,5-trichlorophenyxy)-propionic acid (2,4,5-TP) were attacked only in the presence of a growth substrate such as sodium benzoate. Cell yield on benzoate with the latter two compounds did not differ, suggesting a co-metabolic attack. Small quantities of peptone and/or beef extract had little effect on cell yield but markedly increased herbicide utilization. The observed recalcitrance of at least some organics may be attributed to stringent enrichment isolation procedures which do not allow isolation of actively degrading organisms. Similarly, persistence in the environment may be due, in part at least, to the slow attack in the absence of the stimulatory effect of soluble organic compounds, which are of a transient nature in soil and water.

LAND SURFACE EROSION AND RAINFALL AS SOURCES OF STRONTIUM-90 IN STREAMS,
Agricultural Research Service, Durant, Okla. Quality Management Lab.
R. G. Menzel.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Journal of Environmental Quality, Vol 3, No 3, p 219-223, July-September, 1974. 4 fig, 2 tab, 23 ref.

Descriptors: *Runoff, *Erosion, Strontium, *Streams, Water quality, Radioactivity, Pesticides, Correlation analysis.
Identifiers: Strontium-90.

Strontium-90 concentrations in streams from 1958 to 1967 reflected the changing concentrations in rainfall and accumulation on the land surface. Correlation analysis of data from nationwide sampling networks shows that the Sr-90 concentration in streams was accounted for, on the average, by 1.7% of the rainout 2 months earlier, and annual erosion of 0.58% of the accumulated Sr-90 on the land surface. Direct runoff of Sr-90 in preceding rainfall was highest, 2.0 to 2.2%, in the north central and eastern United States, ranging down to no measurable direct runoff in the southwestern United States. Annual erosion of Sr-90 from the land surface ranged from 0.75% in the Ohio River Basin to 0.17% in the Missouri River Basin. If one allows for differences in time and area of application, these results for land surface erosion indicate the potential movement of persistent, strongly adsorbed pesticides from large land areas. CONTROLLED FOOD-CHAIN TRANSFER OF DIELDRIN RESIDUES FROM PHYTOPLANKTERS TO CLAMS,
Texas A and M Univ., College Station. Dept. of Biology.
S. R. Petrocelli, J. W. Anderson, and A. R. Hanks.
Marine Biology, Vol 31, No 3, p 215-218, 1975. 1 fig, 27 ref.

Descriptors: *Phytoplankton, *Molluscs, *Primary productivity, *Food chains, *Dieldrin, *Clams, Laboratory tests, Halogenated pesticides, Path of pollutants, Adsorption, *Pesticide residues, Water pollution effects.
Identifiers: Dunaliella peircei, Rangia cuneata, Tissue analysis, Bioaccumulation, Sublethal concentrations

The marine phytoplankter Dunaliella peircei was exposed to a concentration of 10 00 micro grams/liter of the chlorinated hydrocarbon insecticide dieldrin in sea-water solution. After 24 hour exposure, the dieldrin residue level in the alga was 12 10 microgram/gram, corresponding to a magnification factor of 1210. Clams, Rangia cuneata, allowed to feed on dieldrin-contaminated phytoplankters for 48 hours exhibited a magnification of dieldrin residues in tissues up to 54 times greater than the concentration resulting from the resuspension of contaminated algal cells in clean seawater. This study demonstrated the transfer of dieldrin residues in a two-level food chain, i.e., from a contaminated alga to a bivalved molluscs allowed to feed on this alga. (KLein)

Aquatic Botany, Vol 1, No 2, p 133-139, June 1975, 5 ref.

Descriptors: *Grasses, *Water pollution sources, *Sewage, *Sediments, Clay, Ecosystems, Environmental effects, Vegetation effects, Soil erosion, Water pollution effects.
Identifiers: *Posidonia oceanica, Gulf of Marseilles(France), *Seagrasses.

Two causes which also represented two stages of the decrease of the seagrass, Posidonia oceanica, were observed in the Gulf of Marseilles. The first cause was determined to be the increase in the level of global pollution, mostly sewage which increased the turbidity of seawater through eutrophication and induced the compensation depth to decrease by 5-8 meters, causing the deepest parts of the beds to disappear. The second cause was related to the increase of clay sedimentation which arose from harnessing the Rhine River. Ecological effects were discussed in relation to the disappearance of Posidonia beds and the existing ecosystems. (KLEIN)

DILUTION AND DECAY OF AQUATIC HERBICIDES IN FLOWING CHANNELS,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Div of Irrigation Research
E. M. O'Loughlin, and K. H. Bowmer
Journal of Hydrology, Vol 26, No 3/4, p 217-23, August 1975. 7 fig, 1 tab, 9 ref, 1 append

Descriptors: *Path of pollutants, *Herbicide, *Aquatic weed control, *Diffusion, *Dispersion, *Australia, *Tracers, Chemical degradation, Flow, Movement, Analytical techniques, Path of pollutants, Aquatic weeds, Irrigation canals, Open channel flow, Model studies
Identifiers: *Concentration-time curves, Acrolein

The behavior of herbicides injected into flowing irrigation channels for aquatic weed control was analyzed. Solutions to the one-dimensional convective-diffusion equation were given for instantaneous and step-function injections of a decaying tracer. The basic solutions were used to derive methods for determining the degradation rate from field experiments, and the total exposure to the herbicide as the water flows over the weeds. It was shown that some significant aspects of herbicide behavior are unaffected by dispersion, and depend only on the degradation rate constant and the travel time of the material. Observations from trials in irrigation channels in the U.S. and Australia with the herbicide acrolein were analyzed. The herbicide application rates and computed exposures varied greatly. Degradation rate constants were more nearly equal. (Lardner-ISWS)

OCCURRENCE AND DISTRIBUTION OF POTASSIUM IONS IN NATURAL WATERS IN INDIA,
Soil Research Lab., Chandigarh (India).
B. K. Handa.
Journal of Hydrology, Vol. 26, No. 3/4, p 267-276, August 1975. 9 fig, 1 tab, 20 ref.

Descriptors: *Surface waters, *Rain water, *Groundwater, *Potassium, *Distribution patterns, Sodium, *Ions, Chemical analysis, Frequency curves, Rivers, Sampling, Analysis, Water analysis, Investigations, Weathering, Water pollution sources, *Path of pollutants.
Identifiers: *India, Natural waters, K/Na ratio.

A systematic study of the distribution of K ions in rainwaters over India gave a mean value of 0.46 mg/l, with values ranging from 0.1 to 2.3 mg/l (n = 130). Rainwater samples were taken in an industrial area near Calcutta, in a more remote area 350 km away, and in other inland towns. In the case of river waters, the mean value obtained was 3.39 mg/l (n = 676), the range being 1 to 13 mg/l. All major Indian rivers were sampled, with weathering, rainfall and agricultural runoff being the major source of K ions. Groundwater samples were taken in areas of differing geological formation. Groundwaters had a mean value of 8.2 mg/l (n = 3067), the K ion concentration ranging between 1 and 80 mg/l. When the chemical composition of the natural waters was plotted on the equilibrium diagrams for silicate minerals at 25C and 1 atm. pressure, it was found that most waters plot in the kaolinite stability field. However, a few rainwater samples plotted in the stability field of gibbsite. (Lardner-ISWS)

CHLORIDE CONTAMINATION IN ALUM CREEK, CENTRAL OHIO.
Ohio State Univ., Columbus. Dept. of Geology and Mineralogy.
W. A. Pettyjohn.
Ground Water, Vol. 13, No. 4, p 332-339, July-August 1975. 8 fig, 7 ref.

criptors: *Water pollution, *Chlorides, nes, *Ohio, Brine disposal, Oil wells, Oil ls, Injection wells, Wastes, Pollutants, Surface ers, Groundwater, Water pollution sources, h of pollutants, Seepage, Soil contamination, er quality, Taste, Discharge(Water), Sam-g, Water analysis.
tifiers: *Alum Creek(Ohio).

odically, Alum Creek at the Westerville water ment plant contains excessive concentrations loride, producing a salty taste. The chloride is removed during the water treatment process. ontaminated surface water and groundwater ughout Alum Creek basin contain less than 25 of chloride. Larger concentrations are related an's activity in the basin, particularly oil uction. The chloride content in samples of aminated surface water ranged from 26 to ly 28,000 mg/l, while samples from oil-field e pits ranged between 3,000 and 57,000 mg/l. n a brief examination of the data indicates that of the chloride contamination in Alum Creek ue to: (1) the discharge of oil-field brines tly into the mainstem or its tributaries in the r reaches of the basin, or (2) the discharge of aminated groundwater into streams. In many s, the highly mineralized groundwater that is seeping into the streams may have been con-nated a decade ago. (Sims - ISWS)

S. I. Kern.
Journal of International Law and Politics, Vol 7, No 3, p 545-573, 1974. 185 ref.

Descriptors: *Water pollution, *International law, *Ships, *Legal aspects, International waters, Governmental interrelations, Oil pollution, Pollutants, Water pollution sources, Water pollution control, Water quality, Wastes, Abatement, Governments, Standards.
Identifiers: *1973 International Convention for the Prevention of Pollution from Ships.

The 1973 International Convention for the Prevention of Pollution from Ships is discussed. The 1973 Covention recognizes the serious consequences of the deliberate, negligent and accidental release of oil and other harmful substances and calls for the elimination of intentional pollution of the marine environment and the minimization of accidental discharges of pollutants. The 1973 Convention represents the first international effort to regulate pollution by noxious substances other than oil and to establish equipment, construction and safety standards designed to minimize the risks of accidental and the desirability of intentional discharge. The 1973 Convention also toughens restrictions on oil discharge and provides for more stringent enforcement. The 1973 Convention applies to ships entitled to fly the flag of a party to the Convention or which operates under the authority of a party. Although the 1973 Convention may bring about a considerable reduction in the discharge of pollutants from ships, economic and technological factors have prevented the imposition of regulations that would totally eliminate vessel-generated pollution. UNITED STATES V GAF CORPORATION (ACTION FOR INJUNCTIVE RELIEF FROM DISPOSAL OF ORGANIC WASTES BY DEEP WELL INJECTION).
389 F Supp 1379-1388 (S D Tex 1975). 10 p.

Descriptors: *Texas, *Judicial decisions, *Federal Water Pollution Control Act, *Injection wells, *Waste disposal wells, Permits, Federal jurisdiction, Federal government, Environmental effects, Legislation, Penalties(Legal), Water law, Water pollution, Water pollution control, Water pollution sources.
Identifiers: Injunctive relief, FWPCA Amendments of 1972, Liability(Legal aspects), Effluent discharges, Administration regulations.

Plaintiff federal government sued defendant corporation to enjoin deep-well injection of organic chemical waste, without the approval of the Environmental Protection Agency. Jurisdiction was sought under Section 1319 of the Federal Water Pollution Control Act (FWPCA) which authorizes a civil action to be brought against anyone who discharges a pollutant in contravention of Section 1311. The district court held that the FWPCA does not apply to subsurface wells. The court reasoned that the failure of an amendment to the Act which would have included such activity compelled such a conclusion. The court further held that even if deep-well injection was covered by the Act, there were no effluent limitations established. Thus, defendant's actions would not be violative of the Act. Defendant's motion to dismiss was granted because plaintiff's complaint failed to show a violation of the anti-pollution provisions of the Act. (Jenkins-Florida)

Identifiers: *Cancer, *Studies, *Harmful compounds.

An estimated 1,000 tons of chlorinated organic compounds, some of them known to induce cancer in lab animals, are discharged annually into the nation's waterways as a result of the chlorination of waste water. As a result of this discharge a new problem has been uncovered: the problem of human health effects. The Environmental Protection Agency (EPA) recently released a study of the New Orleans drinking water supply, which indicated the presence of small quantities of sixty-six organic chemicals, many of them chlorinated hydrocarbons. This announcement was issued shortly after a private study indicated the existence of a significant statistical relationship between drinking New Orleans public water and the incidence of cancer in white males in the area. As a result of this study, an EPA study has begun to determine areas in which these compounds occur and to evaluate the health significance of the compounds at the levels found in the waters. The impact the proposed Safe Drinking Water Bill will have on the chlorine issue is explored. There is also a discussion of the alternative disinfectants which may be used in the place of chlorine to treat water. (Hoffman-Florida)

Identifiers: *Absolute liability, *Liability(Legal aspects), *Refuse Act of 1899.

Appellant corporation, an oil tank farm operator, was convicted in federal district court of violating section 13 of the Rivers and Harbors Act of 1899. The conviction was the result of oil seepage from underground deposits on appellant's property into the navigable waters of Boston Harbor. The appellant contended that the government was required to prove scienter or at least negligence on the part of the appellant, and that the lower court erred by precluding the appellant's defense of due care. The federal government contended that evidence at trial of improper booming by the appellant in its attempts to confine the seepage was sufficient to support the conviction. The First Circuit Court of Appeals affirmed and held that the evidence of improper booming was not sufficient to support conviction, but the absence of any proof that a third party was responsible for the leakage was enough to sustain the lower court's holding. Descriptors: *Waste disposal, *Law enforcement, *Penalties, *Jurisdiction, Judicial decisions, Industrial wastes, Municipal wastes, Sewage Waste treatment, Pollution abatement, Legislation, Illinois, Legal aspects, Water law.
Identifiers: *Separation of powers.

Appeal was taken from an action of the State Pollution Control Board assessing fines against the city and corporation for operating a refuse disposal site without obtaining a permit from the Environmental Protection Agency. Appellant contended that the authority given the Board to impose monetary penalties was a relegation of judicial power in violation of the separation of powers provision of the Constitution of Illinois and the United States Constitution relying on interpretation of the separation of powers provision by the United States Supreme Court and the Supreme Court of Illinois approving delegations of authority to impose civil penalties. The court held the authority granted to the State Board did not violate constitutional mandates. (Proctor-Florida)

Writ of Certiorari was granted by the District Court of Appeal to consider the question of the Florida Department of Pollution Control's authority to require as a condition to the extension of a temporary operating permit the posting of a bond which is absolutely forfeitable in the event of failure to strictly adhere to the compliance schedule. The court held that while it would have been permissible to require a bond against which the Department could execute following a judicial determination of an appropriate penalty for failure to abide by the schedule, the absolute forfeiture provisions were beyond the statutory authority of the Department. SSOLVED LOAD AND TENTATIVE SOLUTE DGETS OF SOME NORFOLK TCHMENTS,
rkshire River Authority, Leeds (England). Pol-on Prevention Dept.
M. C. Edwards.
rol (Amst), Vol 18, No 3/4, p 201-217, 1973, s.

scriptors: *Dissolved solids, Path of pollutants, rates, Sulfates, Phosphates, Rivers, England, rage effluents, Leaching.

ekly water samples were collected during 1970 n the rivers Yare, Tud and Wensum in Norfolk gland). The relationships between discharge the variations in the dissolved load of Na, K, Mg, Si, Cl, bicarbonate, nitrate, phosphate sulfate were examined by regression analysis. correlation coefficients were all highly signifi- and the slopes of the regression equations in t cases approximated to plus 1. The slope coef-ients for nitrate and sulfate were greater than 1, as their concentration increased with harge. Most of the phosphate in the Yare and nsum was derived from sewage effluent, which diluted by high flows. The most effective harges for transporting all constituents were e of winter baseflow. Only 20% of the load removed from the catchments between May Oct. Tentative solute budgets showed that fall was a significant input for K, Mg, Na, Cl sulfate. For chloride in the Tud this amounted 5%. Sewage contributed less than 15% of the t of the constituents except P. It was unlikely more than 10% of the fertilizer N was lost by hing to the rivers. Ca was derived from the tion of carbonate and sulfate minerals. The um carbonate erosion rate was 58.0 Mg/km2 he Yare and 39.2 Mg/km2 for the Tud. The osion rate, correct for depletion by diatoms 1.1 Mg/km2 for the Yare and 0.77 Mg/km2 for Tud.--Copyright 1974, Biological Abstracts,

PHYTOPLANKTON AND EUTROPHICATION IN SOME LAKES IN VESTFOLD, SOUTH NORWAY,
Oslo Univ. (Norway). Inst. of Marine Biology; and Oslo Univ. (Norway). Dept. of Limnology.
K. A. Okland.
Blyttia, Vol 31, No 2/3, p 175-187, 1973, Illus, English summary.

Descriptors: *Lakes, *Eutrophication, *Phytoplankton, Europe, Aquatic plants, Plankton, Lake stages.
Identifiers: Anabaena-spp, Microcystis-aeruginosa, Norway, Vestfold.

The formerly mesotrophic lakes have lately become eutrophic with mass development of Anabaena spp. and Microcystis aeruginosa. The long and severe winter of 1969-70 mobilized nutrients from the bottom sediments. The hot summer of 1970 contributed to the rich algae development.--Copyright 1974, Biological Abstracts, Inc.

GREEN BAY SELF-PURIFIES ALGAL NUTRIENTS,
Wisconsin Univ., Madison.
G. P. Fitzgerald, M. S. Torrey, and G. C. Gerloff.
Water and Sewage Works, Vol 122, No 6, p 58-61, June, 1975. 2 fig, 4 tab, 15 ref.

Descriptors: *Algae, *Algal control, *Municipal wastes, *Lake Michigan, *Cladophora, *Nutrient removal, *Phosphorus, Industrial wastes, Drainage, Water purification, Tertiary treatment, Lakes, Water pollution effects.
Identifiers: Green Bay(Wis), Fox River(Wis), Algal nutrients.

The effects of industrial and municipal waste loadings on the nutrition of the algae along the Fox River at Green Bay, Lake Michigan, were studied. Tests of nutrient concentration in algal samples are used to evaluate the fate of pollutants in aquatic environments. It was proposed that significant reduction of the algal nutrients might be achieved if the removal of phosphorus from their effluents is implemented by major cities in the Great Lakes drainage basin. Sources of nutrients to Green Bay, water flow patterns, phosphorus, nitrogen, and iron concentrations, and bioassays of Cladophora populations were determined. A direct linear relationship was found between concentration of PO4-P and growth of algae in control cultures; addition of nitrogen and/or iron increased growth signficantly. The growth of algae in Lake Michigan seems generally to be limited by available phosphorus during the algal growing season. In early winter, Green Bay, which uses tertiary treatment of municipal and industrial wastes, is effectively self-purified, and does not supply Lake Michigan with major quantities of algal nutrients. It was recommended that other Great Lake areas apply similar phosphorus removal and self-purification practices. (Kramer-FIRL)

MAN'S ACCELERATION OF HYDROGEOCHEMICAL CYCLING OF PHOSPHORUS: EUTROPHICATION OF INLAND AND COASTAL WATERS,
Eidgenoessische Technische Hochschule, Zurich (Switzerland).
W. Stumm.
Water Pollution Control, Vol 74, No 2, p 124-133, 1975. 7 fig, 2 tab, 14 ref.

Descriptors: *Cycling nutrients, *Eutrophication, *Phosphorus, *Lakes, Ecosystems, Environmental effects, Hydrogeology.
Identifiers: Nutrient loading, Lake restoration.

Human activities disturb the natural balance between hydrogeochemical cycles (phosphorus, carbon, nitrogen) in the ecosystem. Pollution results from this disturbance between the rate of production (photosynthesis) and destruction (respiration). This presentation discusses some relevant factors that regulate nutrient composition and productivity. An evaluation is made of the impact of civilization of terrestrial and oceanographic transformations of phosphorus. Also, simple models on phosphorus transformation are reviewed. In particular, correlations have been made between areal nutrient loading of lakes and their enrichment as a function of a specific variables such as depth, retention period, and mixing. It is hoped that an understanding of such eutrophication may help in quantifying measures for lake restoration. (Kramer-FIRL)

NUTRIENT EXCHANGE IN WATER-SEDIMENT INTERFACE AND ITS EFFECTS ON WATER QUALITY,
Rhode Island Univ., Kingston. Dept. of Civil and Environmental Engineering.
C. P. C. Poon.
Available from National Technical Information Service Springfield, Va 22161 as PB-246-275, $3.25 paper coyp, $2.25 in microfiche. Completion Report (1975), 13 p, 17 fig, 15 tab, 3 ref. OWRT B-052-RI(1). 14-31-0001-4123.

Descriptors: Water quality, *Pollutant identification, Chemical analysis, *Sediments, Nitrogen, *Phosphorus, Carbon, Metals, Ammonia, Kinetics, Absorption, *Rhode Island, Bays, Sediment-water interfaces, Nutrients, Iron Manganese.
Identifiers: Sediment profiles, *Narragansett Bay(R.I.), Organic carbon, Marine sediments, *Ammonia-nitrogen.

Profiles of carbon, nitrogen, phosphorus, iron and manganese of Narragansett Bay sediments were established after extensive physical and chemical analyses of samples taken at various locations in the Bay. These profiles reveal the history of pollution in the Bay. Relationships between metals and the nutrients were also established. Clear trends of increasing NH3-N and available-P concentrations in deeper layers of sediments with corresponding decrease of organic carbon were detected. Dredging of the sediment could expose these higher NH3-N and available-P concentrations to the overlying water. Microcosm study showed that the sediments could act as a source or sink of phosphorus under various conditions. The dissolved oxygen content, phosphorus concentration in water and available-P in sediment dictate the amount of P release or uptake by the sediment. In heavily polluted areas, the seawater flushing rate increases the phosphorus flux rate and vice versa. The steady state flux rate of P varies from 20 to 440 ug-P/m2/hr in Narragansett Bay depending on location and flushing rate. No NH3-N release from Narragansett Bay sediments occurs and consequently only phosphorus is considered a potential nutrient source in the sediment.

EFFECTS OF SALMON CANNERY WASTES ON WATER QUALITY AND MARINE ORGANISMS,
Washington Univ., Seattle. Fisheries Research Inst.
D. L. Beyer, R. E. Nakatani, and C. R. Staude.
Journal Water Pollution Control Federation, Vol 47, No 7, p 1857-1869, July 1975, 8 fig, 1 tab, 6 ref.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Water quality, *Canneries, *Industrial wastes, Tidal effects, Salmon, Marine animals, Water pollution sources, Dissolved oxygen, Salinity, Hydrogen ion concentration, *Alaska, Water pollution effects.
Identifiers: *Petersburg(Alas).

Although cannery wastes have presented problems in some Alaskan communities, dissolved oxygen, salinity, water temperature, and pH values in waters affected by discharges near Petersburg showed no appreciable differences from control areas. Results of a survey of intertidal macrofauna indicated that these organisms were not adversely affected by the discharges. Small areas of subtidal waste accumulations and increased turbidities and biochemical oxygen demand in the immediate area of the discharges were the only problems encountered. Tests with undiluted wastes held in a closed system demonstrated that changes in pH and dissolved oxygen may reach undesirable levels in a short period of time. The effects of the discharges were minimized in the field situation, however, by the excellent flushing action of the tides, which resulted in a high dilution and dispersion of the wastes. (Klein)

TOXIC, SUBLETHAL, AND LATENT EFFECTS OF PETROLEUM ON RED SEA MACROFAUNA,
National Marine Water Quality Lab., Kensington, R. I.
R. Eisler.
In: 1975 Conference on Prevention and Control of Oil Pollution:Proceedings, p 535-540, March 1975; 1 fig, 7 tab, 19 ref.

Descriptors: Oil, *Water pollution sources, Aquatic animals, Ecosystems, Enivornmental effects, Growth stages, Coral, Molluscs, Crustaceans, Teleosts, Population, Water pollution effects, *Oil pollution, Dispersion, Path of pollutants, *Toxicity, *Lethal limit.
Identifiers: *Oil dispersants, *Crude oils, Octocorals, Echinoderms, Bioaccumulation, *Red Sea microfauna.

The effects of crude oils, an oil dispersant, and oil-dispersant mixtures on juvenile and adult octocorals, crustaceans, molluscs, echinoderms and teleosts from the Red Sea were investigated. Effects included reduction in feeding rate and egg case deposition of predatory gastropods, interference with substrate attachment by mussels, liver enlargement and lowered blood hematocrit values in fish, and bioaccumulation of crude oils in octocorals. The introduction of petroleum into Red Sea ecosystems was found to be potentially disruptive of established feeding-predator patterns, reproductive patterns, defence mechanisms, and stable populations. THE EFFECT AND FATE OF CRUDE OIL SPILT ON TWO ARCTIC LAKES,
Fisheries Research Board of Canada, Winnipeg (Manitaba). Freshwater Inst.
N. B. Snow, and B. F. Scott.
In: 1975 Conference on Prevention and Control of Oil Pollution:Proceedings, p 527-534, March 1975. 5 fig, 5 tab, 31 ref.

Descriptors: Oil, *Oil spills, *Lakes, Model studies, Benthos, Water quality, Environmental effects, Ecosystems, Arctic, Water pollution effects, Path of pollutants, *Oil pollution.
Identifiers: *Crude oils

Two crude oil spills were carried out on adjacent lakes which were partitioned to obtain experimental and control areas within the same lake. Two types of crude oil were used. Concentration of study was the immediately affected littoral benthos. Comparative data on nitrogen, carbon, and seston weight values, number and distribution of organisms and diatom species colonizing on styrofoam balls, and total chloraphyll concentrations of the pre- and post-oil spill lakes were among the characteristics studied. TOXICITY OF NITRITE TO CHANNEL CATFISH,
Southern Illinois Univ., Carbondale Fisheries Research Lab.
M. Konikoff
The Progressive Fish-Culturist, Vol 37, No 2, p 96-98, April 1975; 1 fig, 3 tab, 13 ref

Descriptors: *Channel catfish, *Toxicity, *Nitrites, Bioassay, Fish physiology, Fish behavior, Environmental effects, Survival, Water pollution effects.
Identifiers: Ictalurus punctatus, *Bioaccumulation, Tissue analysis.

Percent survival values for channel catfish (Ictalurus punctatus) at various nitrite concentrations were determined. The behavior of catfish exposed to lethal and sublethal nitrite concentrations was observed. Nitrite poisoned catfish died with the mouth opened, gill covers closed, pectoral and dorsal spines erected, and body musculature relaxed. The blood was a distinctive dark chocolate brown color which persisted several hours after death. (Klein)

BODY TEMPERATURE CHANGE OF BLUEGILL SUNFISH SUBJECTED TO THERMAL SHOCK,
Virginia Polytechnic Inst. and State Univ. Blacksburg. Dept. of Biology.
J. R. Stauffer, K. L. Dickson, A. G. Heath, G. W. Lane, and J. Cairns, Jr.
The Progressive Fish-Culturist, Vol 37, No 2, p 90-92, April 1975, 2 tab, 5 ref.

Descriptors: *Fish physiology, *Heated water, *Sunfishes, *Powerplants, Effluents, *Temperature, Cooling water, Environmental effects, *Thermal pollution, Water pollution effects.
Identifiers: Heating rates, Fish body thickness.

The lack of significant correlation between length, weight, and condition factors, and time to reach equilibrium with environmental temperature suggested that heating rates were not solely dependent upon the weight or body thickness of bluegill sunfish. Blood flow rate was determining to be an important factor in determing heat exchange. The sunfish required more time to reach equilibrium when exposed to lower temperatures than when exposed to higher temperatures. (Klein)

ESQUE, CHRONICALLY EXPOSED TO
YL-MERCURY IN WATER,
al Water Quality Lab., Duluth, Minn.
lson, D. I. Mount, V. M. Snarski, and T. W.
nd.

Bulletin of Environmental Contamination and Toxicology, Vol 14, No 2, p 129-133, August 1975. 2 tab, 14 ref.

Descriptors: *Heavy metals, *Organic compounds, *Mercury, *Minnows, *Metabolism, Fish physiology, Life cycles, Path of pollutants, Water quality, Toxicity, Water pollution effects, Absorption.
Identifiers: *Fathead minnows, Pimpephales promelas, *Methylmercury, Bioaccumulation, Tissue analysis.

Fathead minnows, Pimephales promelas, were exposed to methylmercury water concentrations ranging from 0.018-0.247 micrograms/liter. After 48 weeks of exposure(lifespan), the total mercury residues in the whole fish body ranged from 1.47-10.90 micrograms/gram. The pronounced uptake of methylmercury and a limited ability to excrete it by the fish suggested that even very low concentrations of methylmercury in water might result in unacceptable tissue levels in fish. SAVE OUR SOUND FISHERIES V CALLAWAY (ACTION TO ENJOIN DUMPING DREDGED SPOIL INTO NAVIGABLE OCEAN WATERS).
387 F Supp 292-310 (DRI 1974). 19 p.

Descriptors: *Judicial decisions, *Federal Water Pollution Control Act, *Permits, *Legislation, *Dredging, Rhode Island, Administration, Contract administration, Federal government, State governments, Water law, Governmental interrelations, Legal review, Environmental effects, Legal aspects, Water pollution, Water pollution control, Water pollution sources.
Identifiers: *National Environmental Policy Act, *Injunctive relief, *Environmental impact statement, *Marine Protection Research and Sanctuaries Act, *Corps of Engineers, Environmental Protection Agency, Fill permits.

Plaintiff, a non-business corporation, composed of corporations which harvest and process seafood, sued to enjoin defendants, U. S. Army Corps of Engineers and a private corporation retained under government contract, from dumping dredged spoil into the ocean. The thrust of plaintiff's complaint was that defendants failed to comply with procedural requirements of various federal laws relating to environmental protection by neglecting to obtain permits, give public notice and opportunity for hearing, and make public disclosure of environmental impact information prior to commencing dredging. Defendants argued that the dumping was part of a project authorized prior to the Marine Protection, Research and Sanctuaries Act and, therefore, required no permit. The court held that the funding for the final stage of the project was appropriated subsequent to statutes requiring a permit, and defendant, therefore, was enjoined from further dumping until compliance with permit procedures. The court further held that 33 U.S.C. section 1344 did not exempt the Corps from complying with permit procedures in authorizing the Secretary of the Army, rather that the Environmental Protection Agency (EPA), to issue permits for dredging and filling for the purpose of improving navigation. Identifiers: Research data, Effluent charges.

Preliminary research data indicate that fluoride can result in significant ecological harm, even at low levels. This chemical has received low priority in research and regulatory control efforts. There is evidence that accumulated levels of fluoride in plant and animal life have caused a major increase of fluoride in aquatic and land food chains. Reduction in fluoride emissions by control regulations may be offset by the rapid growth of the phosphate fertilizer and aluminum industries which emit fluoride. While fluoride pollution mainly occurs from industrial sources, there are more sources of fluoride in the aquatic environment. Although fluoride is present in natural water sources, industrial and domestic sewage discharge accounts for most fluorides. The chemical is best known for its ability to prevent tooth decay and is added to water systems in about one half the communities in the United States. It is likely that fluoride interacts with other pollutants to produce a more toxic effect. Calcium may act to reduce fluoride concentrations. The lack of solid experimental data on the toxic effects of fluoride demonstrates that this chemical should be given higher priority in future environmental research projects. (Jenkins-Florida)

HUMAN ECOLOGY. PROBLEMS AND SOLUTIONS,
P. R. Ehrlich, A. H. Ehrlich, and J. P. Holdren.
W H Freeman and Co.: San Francisco, Calif, 1973, 304 p, Illus.

Descriptors: *Environmental effects, Ecology, Human population, Human resources, Natural resources, Technology.

A comprehensive introducation to human ecology, this book focuses attention on the biological and physical aspects of man's present prlblems. Demography, man's utilization of resources, the world food problem and man's assaults on his own health and on ecological systems are described. Interrelationships of population growth, affluence and technological errors are causes of what may be the most serious crisis ever faced by man. Having established the need to hald population growth, the discussion turns to what is being done in this area, and to what needs to be done. After a discussion of possible population control methods the other aspects of human behavior are evaluated Emphasis is placed on reducing each individual's demand and deleterious impact of the environmental resources. Man's problems are intertwined and it is concluded that ecological problems will not be solved unless racism, poverty, exploitation and war are tackled at the same time. This book is intended for use in various courses dealing with environmental problems and ecology.--Copyright 1973, Biological Abstracts, Inc.

AGRICULTURE'S PLACE IN THE ENVIRONMENT: CONSIDERATIONS FOR DECISION MAKING,
Agency for International Development, Washington, D.C.
W. H. Garman.
J Environ Qual, Vol 2, No 3, p 327-333, 1973.

Descriptors: *Eutrophication, Aquatic plants, Path of pollutants, Nutrients, Organic matter, Agricultural chemical, Fertilizers.

Chemical elements at or near the earth's surface and in the air are in a continuing state of movement or subject to forces which can cause movement. The outstanding characteristic is that outgo of inorganic elements (including plant nutrients) from land to water greatly exceeds input over most land surfaces of the earth. Nutrients have been accumulating under water along the shorelines of the world for ages of time. When man entered the geological picture, this movement (or water-enrichment process) became more active as the soil was worked to grow food. This caused more soil particles, nutrients and organic matter to move into water bodies. Eutrophication is nature's ageold geological process of utilizing these nutrients and the sun's energy for the accumulation of organic matter in aqueous environments. Without eutrophication, there would be no marine life or coal oil or muck deposits on out planet. All bodies of water have 4 stages of life: birth, existence, old age and disappearance. Examples of each stage are found in the USA, Canada, Siberia, Brazil, and Africa, in surroundings practically untouched by man and certainly untouched by agriculture. Only very small quantities of nitrates and mineral nutrients are necessary to sustain luxuriant growth of aquatic plants. Most water bodies contain ample amounts for this purpose. Few situations likely can ever be found where stopping agricultural contribution would stop eutrophication. Slowing the process of eutrophication will be difficult because it will require control over C inputs. Organic matter from sewage, manure runoff, industrial wastes, or wildlife is utilized by bacteria, which evolve CO2 for promoting the growth of aquatic plants. Once the process is in operation, it is difficult to control because photosynthesis releases O2 to stimulate bacteria. When they and other plants die, their C and nutrients are consumed by more bacteria, which in turn, evolve more CO2 to grow more algae, thus continuing the cycle. Although details of this symbiosis are not fully understood, enough is known to realize that removing P or N from city effluents or from farm fertilizers will not control growth of aquatic vegetation in natural or man-made bodies of water.--Copyright 1974, Biological Abstracts, Inc

Descriptors: *Mangrove swamps, Florida.
Identifiers: Sphaeroma terebrans, *Wood borers, Borers.

S. terebrans, a wood-boring isopod, is destroying the prop roots of red mangroves (Rhizophora mangle) along the southwestern coast of Florida (USA) to such an extent that the Ten Thousand Islands and mangrove fringes of the mainland are steadily shrinking. Mangroves of the Florida Keys apparently are free of this wood borer.--Copyright 1974, Biological Abstracts, Inc.

5D. Waste Treatment Processes

VALLEY FORGE AREA WASTEWATER TREATMENT FACILITY, CHESTER COUNTY, PENNSYLVANIA, FINAL ENVIRONMENTAL IMPACT STATMENT.
Environmental Protection Agency, Philadelphia, Pa. Region III.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-236 325, $17.25 in paper copy, $2.25 in microfiche. September, 1974. 426 p, 15 fig, 48 tab, 21 plates, 10 append.

Descriptors: *Administration, *Treatment facilities, *Waste water treatment, Sewers, Federal Water Pollution Control Act, Water quality control, Environmental effects, Grants, *Pennsylvania.
Identifiers: *Construction grants, *Environmental Impact Statement, *Valley Forge(Penn).

An administrative action was taken by the Environmental Protection Agency involving the granting of financial assistance for the construction of a 8 mgd waste water treatment facility and related sewage collection system. Several municipalities in the area of Valley Forge, Pennsylvania, will receive construction grants as dictated in the Federal Water Pollution Control Act Amendments. This final Environmental Impact Statement (EIS) details the climatology, topography, hydrology, geology, man-made environment, air and water quality, population, and land management characteristics of the area serviced. The proposed facilities were designed to meet the waste water treatment needs for eight a Chester County, as projected to the year 19 to alleviate public health hazards, improve quality, and permit orderly growth pattern area. Evaluations were made of several tives including individual treatment proces sewer line locations. Processes such as n tion, landfilling, landspreading, and spray tion were also considered. Included in th EIS are a list of Federal, State and local a from which comments on the Draft EIS h received, a detailed glossary, and 21 map region. Appendices refer to the history proposed project; letters and petitions fr sidents; designated historical and archae sites; existing environmental controls; lists industries; and a summary of a Public held on January 10, 1974. STREAM POLLUTION ABATEMENT B PLEMENTAL PUMPING,
Richmond City Dept. of Public Utilities
C. W. Reh and W. E. Sadler
Available from the National Technical In tion Service, Springfield, Va 22161, as PB-2 $5.25 in paper copy, $2.25 in microfiche. E mental Protection Agency, Report EPA-6 035, February 1975. 108 p, 39 fig, 5 tab, 17 r

Descriptors: *Waste water treatment, *By *Treatment facilities, *Pumping plants, Co tion, Costs, Pumps, Sewage treatment, *V Pollution abatement.
Identifiers: *Richmond(Va)

A major structure (a Supplemental Pumpi tion), and several ancillary structures were to the Richmond, Virginia, Wastewater Tre Plant to achieve the project objective bypassing while a new grit chamber was be nected ahead of the existing Main Pumpi tion. The Supplemental Pumping Station w structed by sinking a two-compartment, sh ferdam around an existing 72-in concrete and rearranging the influent sewer flow pa that the sewage was redirected to the site Supplemental Pumping Station. Redirectio sewage flow was effected by the reconstru a junction chamber and by the insertion o cially designed removable bulkhead. The demonstrated that it is possible to cut in sewage treatment plant addition without by raw sewage. If no special provisions hav made in the existing works or new facility for additions without bypassing, special will be required to achieve the no bypassin tive. Pumping units of standard desing used. Pumps were variable speed motor vertical centrifugal pumps. The time for and construction of so-called temporary f is likely to approach that required for conv facilities. This project required 36 mont cost of the supplemental pumping station purtenant works was $900,000. (Orr-FIRL)

LUATION OF WATER REUSE FOR PAL SUPPLY,
Illinois Univ., Carbondale.
in, and D. O. Baumann.

Available from the National Technical Information Serv' e, Springfield, Va 22161, as AD/A-005 053, $8.75 in paper copy, $2.25 in microfiche. Army Engineer Institute for Water Resources, Ft. Belvoir, Va. Report 74-11, December, 1974. 266 p, 31 fig, 33 tab, 2 append. DACW43-73-C-0013.

Descriptors: *Water supply, *Water demand, *Municipal water, *Water reuse, *Waste disposal, Potable water, Waste water treatment, Recycling, Effluents, Public health, Economics, Simulation, Planning, *Colorado, *Computer programs.
Identifiers: *Colorado Springs(Colo).

Because of an increase demand on municipal water supply systems, reuse as an alternative water source has been considered. Reuse was defined as any additional application of waste water, including inadvertent and unplanned withdrawal and use of water from a river with an upatream discharge, directed and planned secondary treatment, or use of effluents for irrigation, recreation, or industry. An evaluation was made as to whether recycling renovated waste water could be an acceptable and economically efficient alternative. An investigation was made to identify the opinions of state public health officials and consulting engineers toward the practicability of using renovated water. A simulation model as applied to the Colorado Springs, Colorado, water supply system is detailed. Alternative plans, providing for reuse only when required were suggested. Manipulation of water supply and water demand was discussed and the public acceptance or rejection of using renovated water was debated. (Kramer-FIRL)

INTERCEPTOR SEWERS AND SUBURBAN SPRAWL: THE IMPACT OF CONSTRUCTION GRANTS ON RESIDENTIAL LAND USE. VOLUME I, ANALYSIS.
Urban Systems Research and Engineering, Inc., Cambridge, Mass.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-236 477, $7.00 in paper copy, $2.25 in microfiche. Council on Environmental Quality, Washington, D.C., July 31, 1974. 191 p, 8 fig, 1 tab, 2 append.

Descriptors: *Interceptor sewers, *Constructions, *Environmental effects, Federal project policy, Design, *Land use, Land management, Administration, Water resources development, Sewerage.
Identifiers: *Public policy analysis, Federal funding, Sewer construction, Residential development.

A study was conducted in the summer of 1974 to consider the relationships between interceptor sewer construction financed by the Environmental Protection Agency and residential development patterns in rapidly growing communities. A statistical analysis of data from fifty-two interceptor projects was made and case studies for eight local projects with high excess capacity and the largest proportion of vacant developable land in the service area were analyzed. A discussion is given of major interceptor planning and land policy issues, with recommendations for changes in EPA procedure based upon policy analysis. These recommendations included: withholding of Federal funds for excess capacity; re-evaluation of interceptor staging of project design in rapidly growing areas; application of realistic standards for per capita flow; improvement of population forecasting techniques; consideration of environmental effects of interceptor-induced land use; and publicity of community costs and benefits of interceptor-induced growth so as to increase public participation in the planning process. COMMON FUNDAMENTALS IN THE TECHNOLOGIES OF WATER AND WASTE-WATER TREATMENT, (A VIZ-ES SZENNYVIZ-TITAS TECHNOLOGIAIAJAUAK KOZOS ALAPJAI),
P. Benedek, L. Bulkay, and S. Vallo.
Vizugyi Kozlemenyek, No 2, p 210-223, 1975. 8 tab, 3 ref.

Descriptors: *Waste water treatment, *Water treatment, *Treatment facilities, *Biological treatment, Separation techniques, Potable water, Organic compounds.
Identifiers: *Hungary.

A comparison was made between technologies used in water treatment and waste water treatment in Hungary. It was shown that both types of processes are based on the separation of substances according to size. Several tables are presented, systematically comparing the efficiencies of various technologies which are common to both potable water treatment and waste water treatment. In the treatment of waste water, the transformation of organics into inorganics and their subsequent removal, usually by biological treatment, is frequently necessary. In treatment of drinking water, the goal is generally the removal of undesired substances and sometimes the addition of specific chemicals. Despite the difference in objectives, this paper recommends that professionals in the fields of water treatment and waste water treatment note the similarities of the technology applied. INFILTRATION INFLOW PROGRAM FOR EPA GRANTS,
R. A. Beckwith.
Water and Sewage Works, Reference Number, p 16-18, April 30, 1975. 2 fig.

Descriptors: *Infiltration, *Inflow, *Legislation, *Sewerage, *Sewage treatment, Treatment facilities, Rainfall-runoff relationships, Sewers, Federal Water Pollution Control Act, Groundwater, Simulation analysis, *Waste water treatment.
Identifiers: Sewer repair, Infiltration inflow programs.

Federal legislation requires that municipalities applying for new grant funds for interceptors and sewage treatment plants prove their existing sanitary sewer systems are not subject to excessive infiltration/inflow (i/i). Infiltration is primarily leakage from the groundwater table and occurs into cracked pipe, deteriorated lateral connections, or offset joints. Inflow is mainly the water entering a sanitary sewer system from rainfall runoff. Inflow sources are relatively easy to locate and correct, and include manhole covers, roof leaders, area-way drains, basement drains, and connections between storm and sanitary sewers. An i/i program consists of analysis and evaluation. The analysis portion is an overall study of various subsystems, accomplished by studying records of the sewage plant, water plant, and rainfall of an area, and by making selected flow measurements at predetermined key manholes. A choice is then made between continued treatment and evaluation for possible rehabilitation, depending upon which is more economical. Following analysis, evalua-

LIBRARY U. OF I. URBANA-CHAMPAIGN

tion may be performed on recommended areas and consists of a physical survey, rainfall simulation, preparatory cleaning, television inspection, and a cost effective analysis. By locating exact defects and estimating the amount of leakage, it can best be determined whether it is more costly to rehabilitate the defect or to continue treatment of the infiltration/inflow. (Kramer-FIRL)

PREPARING AN INFILTRATION/INFLOW ANALYSIS,
Gilbert Associates, Inc., Reading, Pa.
P. A. Podolick.
Water and Sewage Works, Reference Number, p 31-32, 34, April 30, 1975. 1 tab.

Descriptors: *Infiltration, *Inflow, *Sewerage, *Waste water treatment, Construction, Analytical techniques, Cost analysis, Repairs, Weirs, Sewers.
Identifiers: *Infiltration/inflow, Sewer rehabilitation.

In order to receive Federal funding for upgrading a secondary treatment plant to provide tertiary treatment, it was necessary for an engineering and consulting firm in Pennsylvania to perform an analysis to demonstrate to the EPA that the sewer system discharging into the treatment works was not subject to excessive infiltration/inflow (i/i). First, a review for the past several years of total daily waste water flow was done to compute average daily dry and wet weather flows. Geological and geographic factors were considered, which might influence quantities of waste water flow. Engineering reports and contract documents for the original construction of the sewage facility were also reviewed. Field measurements of drainage from potential infiltration/inflow sources were made between midnight and 5:00 a.m. for key manholes, in order to insure that the measurements were due to i/i and not to domestic sewage. V-notch weirs were used for measurements directly into the sewer pipes. Cost of eliminating infiltration/inflow were determined by sewer system evaluation and a calculation of sewer rehabilitation costs. A cost effective analysis was performed, and it was found that the annual cost of eliminating all the i/i possible and treating the rest was $11,355, while the annual cost of treating i/i for the design life of the facility would be $33,226. Thus, Federal law stated that 'possible' excessive infiltration/inflow existed and that further evaluation was required. (Kramer-FIRL)

HOW TO ANALYZE INFILTRATION/INFLOW,
Environmental Protection Agency, Cincinnati, Ohio.
D. J. Cesaro, and R. Field.
Water and Sewage Works, Reference Number, p 84-88, 90, April 30, 1975. 2 tab, 11 ref.

Descriptors: *Infiltration, *Inflow, *Reviews, Analytical techniques, *Sewerage, Construction, Rehabilitation, Rainfall, Inspection, Water quality, Opearting costs, Maintenance costs, Flooding, *Waste water treatment.
Identifiers: Cost-effectiveness, Infiltration/inflow analysis, Sewer repair, Sewer system evaluation.

A review of the analysis of infiltration/inflow (i/i) is presented. A thorough evaluation should consider factors of cost-effectiveness, including: the cost and size of new sewers if excessive i/i is to be permitted; the operation and maintenance costs for handling local sewer surcharges, clean-up of flooding, and damages to flooded private properties; costs of repair of pavement cave-ins or washouts of subsurface utilities caused by i/i, costs of removal of soil, debris, and tree roots which enter sewers through defective sewer joints and pipes; and need for increases in treatment or handling capacities because systems are overloaded with excessive infiltration and inflow volumes. The required sewer system evaluation survey, consisting of five phases (Physical survey, rainfall simulation, preparatory cleaning, internal inspection, and survey report) is outlined. Guidelines for cost analyses of infiltration and inflow are also given. Examples of an infiltration reduction program in Oklahoma and an inflow reduction program in Illinois illustrate some of the problems encountered. Although a cost-effective solution is strongly recommended, it was concluded that one should always consider the overall impact of any changes on overall water quality. (Kramer-FIRL)

PROCESS FOR TREATING SEWAGE SLUDGE,
American Cyanamid Co., Stamford, Conn. (Assignee).
H. P. Panzer, and K. W. Dixon.
United States Patent 3,894,948. Issued July 15, 1975. Official Gazette of the United States Patent Office, Vol 936, No 3, p 1008, July, 1975. 1 fig.

Descriptors: *Patents, *Sludge treatment, *Dewatering, *Polymers, *Waste water treatment, Anions, Cations.
Identifiers: Polyquaternary compounds.

A patent was granted for a method of sewage sludge treatment. An effective amount of a water-dispersible polyquaternary polymer is added to the sewage, comprising the reaction product of dimethylamine, a polyfunctional amine, and a difunctional epoxy compound selected from the group consisting of epihalohydrins and precursors for epihalohydrins which under alkaline conditions are readily converted into the corresponding epoxy compounds and their mixtures. The polyquaternary polymer structures are detailed, and the residues obtained from the compounds and their reactions are described. The amount of anions present is large enough to satisfy anionic requirements of the cationic portion of the polyquaternary compound and thus water is removed from the sludge. (Kramer-FIRL)

APPARATUS FOR DISSOLVING LARGE QUANTITIES OF OXYGEN IN WATER,
Naigai Kogyo Kabushiki Kaisha, Tokyo (Japan). (Assignee).
T. Aoki.
United States Patent 3,882,205. Issued May 6, 1975. Official Gazette of the United States Patent Office, Vol 934, No 1, p 327, May, 1975. 1 fig.

Descriptors: *Oxygenation, *Aeration, *Patents, Equipment, *Water treatment, *Waste water treatment, *Dissolved oxygen.

The patented apparatus described is designed for dissolving large quantities of oxygen in water. It is composed of: an air-tight cistern; a tank on the cistern; an elongated inner vessel in the cistern with a perforated partition between it and the tank; a rotary shaft with a perforated drum, positioned perpendicularly within the tank; pipes for supplying oxygen to the drum and water to the tank; spouts which discharge water into a receiving dish on the rotary shaft; and, conduits to feed water and to control discharge of water to the dish from the spouts. Water is finely divided by the high speed rotation of the dish caused by rotation of the rotary shaft. Oxygen is released into a circular space between the outer circumference of the drum and the inner circumference of the tank through perforations, due to the centrifugal force of the drum also being rotated by the shaft. Water and oxygen mixing occurs continuously, dissolving a large volume of oxygen into the water. The water enters the inner vessel through [illegible] forated partition and is then passed into the [illegible] through an opening on the vessel. (Orr-FIR

WASTE TREATMENT SYSTEM WITH ENCLOSED SCREEN UNIT,
V. Materese.
Canadian Patent 973,304. Issued August 26, 1975. Patent Office Record, Vol 103, No 34, p 1, August 26,1975.

Descriptors: *Waste water treatment, *Waste treatment, *Solid wastes, Slurry, *Patents, Treatment facilities, Equipment, *Screens, Chemicals, Disinfection, Mixing.

The patented waste treatment system described includes means for grinding solid wastes, mixing them with liquids to form a pumpable slurry and pumping the slurry to a waste treatment tank. The waste treatment tank has a screening section in which an enclosed screen unit is loosely positioned. The slurry is pumped to the interior of the screen unit and then flows outwardly through the foraminous side walls of the screen unit into a mixing section of the treatment tank. As the screened waste material is passed from the screening section of the treatment tank to the mixing section, it is mixed with chemical additives. A series of perforated baffles in the mixing section insures that the additives and screened waste material are intimately mixed and retained in the tank for a sufficient period of time to disinfect the mixture prior to its ejection from an outlet in the mixing section of the treatment tank. SEWAGE TREATMENT APPARATUS AND METHOD,
G. W. Smith.
Canadian Patent 972,088. Issued July 29, 1975. Patent Office Record, Vol 103, No 30, p 89, July, 1975.

Descriptors: *Patents, *Activated sludge, *Waste water treatment, *Biological treatment, Sewage treatment, Effluents, Sludge disposal, Aeration, Waste disposal.

A method and its related equipment were patented for use in the activated sludge treatment of sewage. Raw sewage is mixed with return (activated) sludge and the mixed sewage liquor is then confined in a tank and aerated. There may also be additional sub-surface aeration. Air is circulated through the sewage in a pre-determined vertical flow pattern through several flow passageways within the tank. After the required amount of time, the treated sewage liquids are removed from the tank; sludge is removed for recycle or ultimate disposal; and effluent water may be clarified. (Kramer-FIRL)

Canadian Patent 972,880. Issued August 12, 1975. Patent Office Record, Vol 103, No 32, p 85, August, 1975.

Descriptors: *Sewage treatment, Tanks, *Patents, *Flocculation, *Waste water treatment, Sedimentation, Flow, *Settling basins.

A highly efficient tank for the treatment of sewage has been patented. The unit is a combined sewage flocculating and sedimentation process. Flow of sewage is described, such that when seen in a plate view, the sewage is directed substantially perpendicular to the longitudinal direction of the tank. When viewed from a vertical section, flow is obliquely upward. Connections between the flocculating portion and the sedimentation protion are such that sewage flows through the tank and then to an outlet within the sedimentation portion. (Kramer-FIRL)

LIBRARY U. OF I. URBANA-CHAMPAIGN

METHOD OF AND APPARATUS FOR FILTERING,
Hydromation Filter Co., Livonia, Mich (assignee).
G. Hirs.
United States Patent 3,900,395. Issued August 19, 1975. Official Gazette of the United States Patent Office, Vol 937, No 3, p 952, August, 1975. 1 fig.

Descriptors: *Patents, *Filters, *Waste water treatment, Separation techniques, *Filtration.
Identifiers: Filter bed media, Black walnut shells, Anthracite coal, Solids removal.

A new filter device was patented for the removal of solids from liquid. The filter media bed is composed of anthracite coal, characterized by primary filter granules and smaller, fine, flaky particles. The bed has upper inlet and lower outlet surfaces; the smaller particles tend to accumulate at the inlet surface after backwashing and thus inhibit penetration into the anthracite bed by particulate contaminants. Positioned on the inlet surface of the bed are black walnut shells. These should be selected of a size and shape in relation to the fine anthracite particles in order to intermix with them after backwashing. The walnut shells have an angular, three-dimensional configuration to inhibit binding off the bed of anthracite coal byfine particles and accumulated contaminants. In the inlet surface of the filter media bed, a portion of the black walnut shells are intermixed with the smaller fine particles and provide a more effective penetration of the inlet surface by contaminants, thus improving the filter capabilities of the bed. PROCESS FOR TREATING WASTE WATER EFFLUENT HAVING ODOURS,
Daikyo Oil Co. Ltd., Tokyo (Japan). (assignee).
K. Tsutsumishita, Y. Yokoyama, and T. Egawa.
United States Patent 3,903,250. Issued September 2, 1975. Official Gazette of the United States Patent Office, Vol 938, No 1, p 333, September, 1975.

Descriptors: *Patents, *Waste water treatment, Effluents, Hydrogen ion concentration, Odor, Hydrogen sulfide, Organic compounds.
Identifiers: *Odor control.

A patent was issued for a treatment method for waste water containing hydrogen sulfide, mercaptanes, or other sulfur compounds, in order to eliminate undesirable odors. The pH of the waste water should be adjusted to 6 to 7 with a mineral acid or alkali; the waste water effluents may then be contacted with a hydrocarbon oil. The oil must have an average molecular weight of 100 to 300, and the mixing ratio of the hydrocarbon oil to the waste water effluent should be ten to one:one by volume. (Kramer-FIRL)
W76-00596

METHOD FOR THE PURIFICATION OF WATER,
N. Lindquist.
Canadian Patent 972,484. Issued August 5, 1975. Patent Office Record, Vol 103, No 31, p 85, August, 1975.

Descriptors: *Patents, *Sewage treatment, *Flocculation, *Nutrient removal, Biological treatment, *Waste water treatment, Oxygen, Microorganisms, Organic matter, Biodegradation, Iron, Aluminum, Separation techniques.

A method has been patented for the purification of sludge-free sewage which contains biodegrable organic material and phosphorus compounds. Sewage is passed through an oxygen-containing gas, and through a permeable bed which contains at least one metal of the group consisting of iron aluminum. The flow of the oxygen-containing gas is then adjusted, as is the thickness of the bed, so that biological microorganisms capable of decomposing the organic material in the sewage are formed in at least one portion of the bed. At the same time, at least one metal is dissolved from the bed in a large enough quantity to flocculate most of the phosphorus compounds in the sewage. The permeability of the bed must be such that the formed phosphorus-containing flocs, together with the formed biological flocs, are able to pass through the bed and the sewage is then separated from these flocs. (Kramer-FIRL)

RECENT TRENDS OF INSTRUMENTATION, CONTROL, AND AUTOMATION SYSTEMS FOR WASTEWATER TREATMENT SYSTEMS (GESUIDO SHISUTEMU SEIGYO NO DOKO),
S. Kato, and T. Oto.
Hitachi Hyoron, (Hitachi Review), Vol 57, No 2, p 3-7, February, 1975. 5 fig, 11 ref

Descriptors: *Instrumentation, *Waste water treatment, *Automation, *Control systems, Sewage treatment, Water treatment, Computers, Treatment facilities, Tertiary treatment.
Identifiers: *Japan.

Recent trends of instrumentation, control, and automation systems for waste water treatment are described. The establishment of a better sewage systems in Japan is urgently needed, with advanced treatment of sewage in large cities necessary because of the increasing populations of these cities. An effective reutilization of waste water is required, and may be accomplished by the establishment of different water lines for different types of water usage. For better control in waste water treatment plants, the concept of a hierarchical system should be employed, in which all controlling units for individual steps in water treatment are interrelated. The use of a computer is essential for this control system. The advantages of such a system are the high reliability and flexibility of the control system in cases of partial malfunctionings of treatment units. Another advantage is the high efficiency in controlling waste water treatment, particularly for large scale treatment plants. (Katayama-FIRL)

USING HYDROGEN PEROXIDE FOR POLLUTION CONTROL.
Water and Sewage Works, Reference Number, p 186-188, April 30, 1975. 5 fig, 7 tab.

Descriptors: *Waste water treatment, *Water pollution control, *Odor, *Activated sludge, Physical properties, *Density, Aqueous solutions, Oxygen.
Identifiers: *Hydrogen peroxide, Mixed liquor suspended solids.

The compound hydrogen peroxide (H2O2) has several applications in pollution control. It has been used for odor control, reduction of bulking in the activated sludge process, for better settling of the mixed liquor suspended solids, and for the addition of oxygen to waste. Hydrogen peroxide itself is not a pollutant and leaves no toxic residues. Because an increasing number of municipalities and industries are utilizing this compound, some of its important physical properties are described. Tables reproduced from the FMC Corporation book entitled 'Hydrogen Peroxide Physical properties Data Book' provide information on p cal properties, measured in density of aqu hydrogen peroxide solutions at zero degrees tigrade, physical properties measured in dens aqueous hydrogen peroxide solutions at 25° a degrees centigrade, weight percent mole fra conversion and average molecular weight hydrogen peroxide-water solutions; densit aqueous hydrogen peroxide solutions in de Baume; and the composition of particular do position products. SPECIFICATIONS FOR GRANULAR FIL MEDIA,
University Coll., London (England).
K. J. Ives.
Effluent and Water Treatment Journal, Vol 16 6, p 297-305, June, 1975. 7 fig, 1 tab, 8 ref.

Descriptors: *Filtration, *Filters, *Waste w treatment, *Water treatment, Standards, Par shape, Particle size, Sands, Sieves.
Identifiers: Granular filter media specification

The use of coal, pumice, plastics, ceramics, net, ilmenite, alumina, and magnetite as media instead of sand, makes it desirable to pose a British Standard for granular filter m and to agree on methods used for testing media. A basis for a filterability test could be Filterability Number F, which relates head filter rate, average quality of filtrate during ing, quality of influent, and duration of test. lowest value of F represents the best filterab The use of sieves is the most practical grain si technique. Desirable size depends on the cha teristics of the suspension to be filtered. Sieve can be specified by the Hazen effective Shape can be defined in terms of spheri hydraulic diameter divided by sieve size. Sphe ties of less than 0.6 would be unacceptable, s the grains would be too flaky and would sett an unisotropic manner, resulting in rapid clog

nique optimal density exists. The density ld be greater than that of water. An upper ty limit is imposed by the conditions necessa- or backwashing (greater density requires er size). Durability standards should relate to rmance of the saturated media. The media d be whole grains, not cemented ag- erates. Solubility can be specified in terms of lution in acid. Leachate specifications may be l on World Health Organization International lards for Drinking Water. Since surface co-chemical properties cannot be signifi- altered, it is not necessary to formulate fications. Fall velocity does not need to be fied as it depends on the already specified neter of size, shape, and density of the grains. FIRL)

HIGHER PROFITS VIA ADVANCED INSTRUMENTATION,
Liptak Associates, Stamford, Conn.
B. G. Liptak.
Chemical Engineering, Vol 82, No 13, p 152-158, 160, 162, June 23, 1975. 9 fig, 2 tab, 16 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Control systems, *Instrumentation, Cost-benefit analysis, Costs, Industrial water, Municipal water.
Identifiers: *Advanced control systems.

In most chemical process plants, it is possible to increase production by about 20% by updating the instrumentation. A waste water treatment plant is considered in the example given but the approach used for systems evaluation and cost-benefit analysis can be applied to any other type of plant. Each of the main unit-operations found in a typical industrial or municipal waste water treatment plant is briefly reviewed with respect to instrumentation. The purposes of control systems are described and the traditional methods of instrumentation are compared with the capabilities of more- advanced control systems. Advanced controls include feedforward, multivariable, adaptive or optimizing systems. Before evaluating advanced controls, the conventional loops must be fully utilized. Whenever a new control strategy is suggested, a cost- benefit analysis should be performed. This analysis should identify the economical and other benefits to be gained from the new control system, and in addition should present the associated capital and operating costs. (Orr-FIRL)

A STRATEGY FOR WATER POLLUTION CONTROL IN BRITAIN,
M. W. Askew.
Water and Pollution Control, Vol 113, No 8, p 16-18, August, 1975. 2 fig, 2 tab, 7 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Water resources, *Administration, *Conferences, Management, Planning, Biological treatment, Tertiary treatment, Water pollution control.
Identifiers: Physico-chemical treatment, *Great Britain.

A synopsis of the Annual Conference of the Institute of Water Pollution Control held at Scarborough, England, is given. This conference provided the first opportunity for a national discussion of the major reorganization of administration of water resources in England and Wales which became effective in April of 1974. The Water Act 1973 transferred the overall responsibilities for water resources to nine regional water authorities in England and a National Water Development Authority in Wales. The first session of the conference discussed corporate management for water authorities. Corporate management was defined as the management organization and structure of an authority necessary fr comprehensive planning and implementation of the use of its resource to achieve its aims. A paper entitled 'Water Resource Planning' identified the role of the water resources planner as developing long-term strategies which would meet multiple objectives at minimal cost. Future prospects of water authorities were dealt with in two papers on 'Operations in Regional Water Authorities, and 'Scientific Services in Regional Water Authorities.' Distinctions were made between physico-chemical treatment of raw sewage and physico-chemical methods for tertiary treatment. Two physico-chemical and biological sewage treatment pilot plants under construction as part of an advanced waste treatment project for NATO were also discussed. (Orr-FIRL)

A HISTORY OF SEWAGE WORKS' MACHINERY,
J. D. Cargill.
Water Pollution Control, Vol 74, No 4, p 430-454. 1975. 9 fig, 127 ref.

Descriptors: *Waste water treatment, *Sewage treatment, Treatment plants, Equipment, Pumps, Screens, Aeration, Sludge treatment, Centrifuges, Filters, Dewatering, History.

A history of the machinery associated with sewage treatment facilities is presented. Since the development of this equipment reflects the development of treatment methods, a review of the developing processes is also presented. The principal methods employed in the nineteenth century were irrigation, filtration and chemical precipitation. Biological processes were developed late in the nineteenth century. By the 1930's, most of the equipment available today had been developed; many improvements have been made during the last forty years. Descriptions are given of machinery that had actually been used in practice from 1840 to mid-1930. Sewage works' machinery can be divided into three broad groups: pumps, screens, detritus removal and scrapers that are used irrespective of the type of treatment; equipment associated with biological processes, such as distributors and aeration equipment; and, the machinery associated with sludge treatment, such as centrifuges, vacuum filters, and filter belt presses. OTTAWA PLAYS KEY ROLE IN TECHNOLOGY TRANSFER,
Environmental Protection Service, Ottawa, (Ontario).
A. B. Redekopp.
Water and Pollution Control, Vol 113, No 8, p 6, 35, August, 1975.

Descriptors: *Training, *Professional personnel, *Water pollution control, *Canada, Conferences, Waste water treatment, Industrial wastes, Municipal wastes, Treatment facilities.
Identifiers: *Technology transfer.

The development of training packages, courses and seminars for personnel involved in the water pollution control field by the Training and Technology Transfer Division (Water) and the Environmental Protection Service in Canada is described. In the Maritime Provinces, a program for waste water treatment plant operators has been designed to train those plant operators in the field as well as new student operators. The format is an audio-visual unit (Slides and tapes) with a printed workbook. Additionally, three-day operator training programs have been successfully implemented for extended aeration plant (Package plant) operators. For the pulp and paper industry as well as the petroleum refinery industry, special three-day seminars have been conducted. These are designed for regulatory staff employed both federal and provincial governments and discuss the various unit processes involved in the particular industry. Proceedings from the pulp and paper session have already been published and proceedings of the petroleum refinery session are to be published in the next few months. Discussions are related to industrial regulations and guidelines pertaining to current waste water treatment technology. Much emphasis has been placed on these seminars and conferences by the Environmental Protection Service because the individual plant managers in the typical Canadian small industrial operation does not have the time on a weekly basis to study new information. However, most managers do have the opportunity to attend these special seminars to focus on an important area of concern to their specific field of water pollution control. (Kramer-FIRL)

STUDIES ON FLOC-FORMING SUBSTANCES IN ACTIVATED SLUDGE. II. FLOC-FORMING ACTION BY THE VISCOUS SUBSTANCE EXTRACTED FROM ACTIVATED SLUDGE BY ALKALINE SOLUTION. (IN JAPANESE),
Gifu College of Pharmacy, (Japan).
T. Sato, and Y. Ose.
Eisei Kagaku, Journal of Hygienic Chemistry, Vol 21, No 2, p 55-59, 1975. 7 fig, 9 ref.

Descriptors: *Activated sludge, *Flocculation, *Acidity, E coli, Analytical techniques, Separation techniques, *Waste water treatment.
Identifiers: *Floc-forming abilities, Alkaline solution extraction.

An investigation was made on floc-forming substances in activated sludge. Highly viscous substances were extracted from activated sludge 2 N and 0.1 N sodium hydroxide solution. Their abilities to form flocs were observed. Both of these alkaline extracts were seen to flocculate kaolin and E. coli suspensions at a pH below 3, but not near the neutral pH of 7, which is within the flocculating range for activated sludge. Because the substance extracted from activated sludge was insoluble in a strong acidity range, it was postulated that a correlation may exist between acid insolubility and flocculation. (Kramer-FIRL)

ORGANIC RESIDUE IN RECYCLED EFFLUENT, PART II,
Utah State Univ. Logan
V. D. Adams, E. J. Middlebrooks, and P. D. Nance.
Water and Sewage Works, Vol 122, No 7, p 98-99, July, 1975

Descriptors: *Organic compounds, *Chlorination, Analytical techniques, *Water reuse, Effluents, Recycling, Public health, Water pollution sources, Potable water.
Identifiers: Chlorine residual.

There has been much concern abouth the hazard of consuming recycled water because of the chlorinated organic compounds which may be found. An investigation was conducted to study liquids resulting from the use of chlorine as a disinfectant. Although the present study involved reuse of waste water treatment effluents for flushing purposes, and not for human consumption, data should be applicable to other chlorination uses. Material was isolated from recycled effluents by extraction techniques and was found to be a complex mixture, consisting mainly of saturated chlorinated fatty acids. Lipids were present in feces in a quantity significant enough to result in such saturated chlorinated fatty acids, due to a conversion process by free radical chlorination. The rate of accumulation of these chlorinated fatty acids is directly related to the concentrations of lipids added to the system and to the free chlorine maintained in the recycled effluent. Therefore, it is useful to determine the level of organic carbon acceptable in the recycling system so that the bactericidal and virucidal properties of chlorine are not impeded. This will establish a minimum level for acceptable free chlorine residual for the recycled effluent. (Kramer-FIRL)

Identifiers: *Waste recovery, Nonferrous metal industry, Aluminum fabricating wastes, Bright finishing wastes, *Phosphoric acid wastes.

A pilot plant study was carried out which demonstrated the effectiveness and economic feasibility of a unique ion exchange process referred to as 'acid retardation' for purifying spent phosphoric acid used in bright finishing aluminum parts. A continuous ion exchange system was employed to separate the aluminum contamination from a spent phosphoric acid waste obtained from a manufacturing plant. The anion resin accomplishes the separation by retarding the phosphoric acid as the processing solution flows through the bed. The aluminum remains in the waste solution and passes out of the column in the effluent. The acid is then eluted from the bed with water, eliminating the use of chemicals which are needed to regenerate the resin in conventional ion exchange systems. (EPA)

NSTRATED TECHNOLOGY AND
ARCH NEEDS FOR REUSE OF MU-
AL WASTEWATER,
ngineers, Long Beach, Calif.
chmidt, and E. V. Clements, III.

Available from the National Technical Information Service, Springfield, Va. Environmental Protection Agency, Report EPA-670/2-75-038, May 1975. 338 p, 37 fig, 50 tab, 340 ref, 7 append. ROAP 21-ASB - Task 011 1BB033.

Descriptors: *Water reuse, *Waste water treatment, *Municipal water, Water conservation, *Recycling, Sites, Water resources, Cooling water, Water supply, Attitudes, Industrial water, Irrigation.
Identifiers: *Reuse technology, Domestic reuse, Recreation reuse.

This survey identified 358 sites at which direct reuse of municipal wastewater was being practiced. Detailed data were gathered on volume, effluent quality, treatment, reliability and economics. Direct reuse of municipal wastewater was not widespread; it accounted for less than 2 per cent of this nation's water use in 1972. Irrigation and industrial cooling account for virtually all of this reuse. Only three sites practice reuse for recreational lakes, and one for nonpotable domestic use. Potable reuse is not presently practiced. General quality standards could not be derived for any category. In fact, water which is substandard according to published criteria is being successfully used in many reuse situations by fitting the water quality to the specific local condition. Overall economic analysis was also difficult. Storage and distance between supplier and consumer were more important considerations than quality and treatment. In general, the supplier undercharged the consumer because reuse was viewed as an inexpensive disposal technique. There is significant potential for an increase in reuse of wastewater in all categories; increased publicity concerning successful reuse is required to initiate this increase. (EPA)

ADVANCED AUTOMATIC CONTROL STRATEGIES FOR THE ACTIVATED SLUDGE TREATMENT PROCESS,
Systems Control, Inc., Palo Alto, Calif.
J. F. Petersack, and R. G. Smith.
Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-670/2-75-039. May 1975. 154 p, 33 fig, 11 tab, 14 ref, 3 append. 1BB043; ROAP 21ASC; Task 007 R800356.

Descriptors: *Automatic control, *Waste water treatment, Dissolved gases, Oxygen, Sludge treatment, *Activated sludge, Instrumentation, Computers, Data acquisition, Suspended solids, *California, Sewage treatment.
Identifiers: *Palo Alto(Calif), Badger meter respirometers, Astro ecology TOC analyzer, IBM system/7, Keene suspended solids.

Results of a demonstration of the feasibility and benefits of applying several advanced wastewater treatment control strategies in an operational treatment plant using a digital computer are presented. The work was conducted in a full size (35 MGD capacity) secondary treatment plant at Palo Alto, California. Control strategies tested were for the secondary treatment portion of the process and involved regulation of aeration tank dissolved oxygen (DO) and food for microorganism ratio (F/M). Two variations of F/M ratio control were evaluated using respectively air flow and a direct measurement of sludge respiration with an on-line respirometer to estimate food (BOD). An extensive data collection program was incorporated which allowed detailed statistical evaluation of each control algorithm with regard to performance, effluent quality impact, operating costs, and reliability. Comparison was made to similar data collected during benchmark manual operation tests. Overall results indicate digital control using advanced control concepts is feasible and that demonstrable improvements in effluent quality are obtained. Direct operating cost savings in the form of an 11% reduction in air use was also shown for DO control. (EPA)
W76-00693

BIOLOGICAL TREATMENT OF COMBINED SEWER OVERFLOW AT KENOSHA, WISCONSIN,
Envirex Inc., Milwaukee, Wis.
R. W. Agnew, C. A. Hansen, M. J. Clark, O. F. Nelson, and W. H. Richardson.
Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-670/2-75-019, April 1975. 246 p, 46 fig, 18 tab, 31 ref, 4 append. 1BB034; ROAP 21-ASY; Task 139 11023 EKC.

Descriptors: *Sewage treatment, *Waste water treatment, Activated sludge, Runoff, *Biological treatment, Overflows, *Wisconsin, *Combined sewers, Water pollution, *Surface runoff.
Identifiers: *Contact stabilization, *Kenosha(Wis), Dual use, Dry/wet weather treatment, Combined sewage, Combined sewer overflow.

A description is presented for the design, construction, operation and two-year evaluation of a biological process used for the treatment of potential combined sewer overflow. A 75,700 cu m/day (20 mgd) modified contact stabilization process was constructed on the grounds of an existing 87,055 cu m/day (23 mgd) conventional activated sludge plant at a total cost of 1.1 million dollars. The demonstration system consisted of pumping facilities, the conversion of an unused flocculation basin into a grit basin, construction of a contact tank and stabilization tank, installation of a final clarifier and all associated yard piping and automatic control equipment. The demonstration system's raw sewage pump and clarifier were used by the dry weather plant when the demonstration system was not in use. Results from the evaluation program proved the demonstration system to be a feasible concept for the treatment of potential combined sewer overflow. The system was operated and evaluated during 49 runs in which 681,300 cu m (180,000,000 gal.) of potential overflow was treated. Based on these tests, expected removal efficiencies for suspended solids, BOD, and TOC are 90%, 85%, and 76%, respectively. Operating costs for running the system 300 hours per year are estimated at 3.567cents/cu m (13.5cents/1000 gal.). An additional benefit derived from the demonstration system was improved removal efficiencies by the dry weather plant through utilization of the demonstration system facilities. (EPA)

URBAN STORMWATER MANAGEMENT MODELING AND DECISION-MAKING,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
J. P. Heaney, W. C. Huber, H. Sheikh, M. A. Medina, and J. R. Doyle.
Available from the National Technical Information Service, Springfield, Va 22161. Environmental Protection Agency, Report EPA-670/2-75-022, May 1975. 185 p, 37 fig, 47 tab, 95 ref. 1BB034 ROAP:ATA Task:015 802219 (11023 GSC).

Descriptors: Water storage, Simulation analysis, Rainfall, Runoff, Vegetation, Waste treatmen, Erosion control, Optimization, Cost analysis, *Combined sewers, *Water pollution, Computer programs, Decision making, *Computer models, *Storm drains, *Storm water, *Cost sharing.
Identifiers: Lancaster(Pa), *Urban stormwater management model.

The purposes were to test, refine and augment the capabilities of the EPA Storm Water Management Model (SWMM), and to develop decision-making capabilities for use in the study of urban stormwater runoff problems. With regard to the SWMM the numerous programming refinements were introduced to provide reliability and flexibility. A sediment prediction capability has been incor-

LIBRARY U. OF I. URBANA-CHAMPAIGN

porated directly into the SWMM. Detailed testing was conducted in Lancaster, Pennsylvania to demonstrate the ability of the SWMM to describe the relatively complex phenomena occurring in an urban catchment. A systematic procedure is presented for examining the stormwater management problem in the broader context of urban water resources management. Related standards for flood control and drainage, street and parking lot design, etc., are reviewed and suggestions presented regarding modifications in practices which would ameliorate stormwater problems. An optimization procedure is described which addresses the related problems of finding efficient and equitable control strategies. Lastly, the use of the SWMM for preliminary hydraulic design of sewer systems is described. (EPA)
W76-00695

AN INTEGRATED POWER PROCESS MODEL OF WATER USE AND WASTE WATER TREATMENT IN CHLOR-ALKALI PRODUCTION,
Houston Univ., Tex. Dept. of Quantitative Management Science.
F. D. Singleton, Jr., J. A. Calloway, and R. G. Thompson.
Water Resources Research, Vol 11, No 4, p 515-525, August, 1975. 11 fig, 4 tab, 22 ref.

Descriptors: *Waste water treatment, *Costs, *Water quality standards, *Industrial plants, Water pollution, Waste water(Pollution), Model studies, Economics, Water treatment, Water quality control, Water utilization, Chlorine, Mercury.
Identifiers: Mercury cell plants, Diaphram cell plants, *Chlor-Alkali production.

An economic evaluation was made of the effects of increasingly restrictive waste water effluent standards and higher costs of water withdrawals on resource use, waste discharges, and costs of producing chlorine and caustic. Mercury and diaphragm cell methods of production were studied for large modern plants at the design stage. Zero discharges of total solids increased production costs 5.6% in diaphragm cell plants and 12.1% in mercury cell plants. Zero discharge restrictions of mercury may only be accomplished by use of diaphragm cells. (Robinett-Arizona)

NITRIFICATION RATE IN BIOLOGICAL PROCESSES,
Metcalf and Eddy, Inc., Boston, Mass.
C. S. Huang, and N. E. Hopson.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE2, p 409-422, April, 1974. 3 fig, 78 ref, 2 append.

Descriptors: *Nitrification, Rates, Sanitary engineering, Biological properties, Laboratory tests, Reviews, Bibliographies.
Identifiers: *Reaction rate equation.

A review of literature concerning the nitrification process shows a diverse opinion as to the reaction rate equation for the process. Four reaction rate equations are reviewed and an experimental study performed to determine the correct equation is described. From the initial ammonia nitrogen concentration and the contact time studies the nitrification process was shown to follow a zero-ordered reaction. This conclusion is in disagreement with some of the reviewed literature. However, many experimental and evaluation problems may cause researchers to assume first-order reaction rates in their nitrification studies. The expression 'percent removal' or 'percent remaining' usually used in BOD reactions is not a meaningful way to evaluate the reaction rate. A small change in pH caused by the H+ ions released from the nitrification process also may affect the results of nitrification studies (Skogerboe-Colorado State)

ADVANCED PROCESSES: WATER DESALTING AND REUSE,
Arizona Univ., Tucson. Dept. of Civil Engineering and Engineering Mechanics.
R. A. Sierka.
In: Conference on Water Requirements for Lower Colorado River Basin Energy Needs, May 8-9, 1975, p 206-230. 3 fig, 6 tab, 12 ref.

Descriptors: *Waste water treatment, *Recycling, *Water reuse, *Desalination, *Water quality, *Biological treatment, Coagulation, Filtration, Flocculation, Oxidation, Reverse osmosis, Activated carbon, Industrial wastes, Municipal wastes, Semipermeable membranes, Waste water(Pollution), Water pollution, Water treatment, Sewage treatment, Tertiary treatment, Water conservation, Electrochemistry, Water chemistry, Inorganic compounds, Organic compounds, Nutrients, Suspended solids, Ozone, Chlorination, Ion exchange, Economics.

To upgrade polluted water to a quality level demanded by a potential user requires various degrees of treatment including the use of advanced treatment processes either singly or in combination. Process sequencing is of prime importance since the system's optimization often depends on previous pollutant removals. Described are advanced treatment processes for the 5 pollutant categories: (1) dissolved inorganics, (2) dissolved organics, (3) nutrient species, (4) suspended particulates, and (5) living matter. Reverse oxmosis or electrodialysis is used for (1, activated carbon adsorption, oxidation with ozone, or wet air oxidation for (2), coagulation and flocculation with metal coagulants with biological cellular uptake for phosphorous, or air stripping, ion exchange, breakpoint chlorination, and nitrification-denitrification for nitrogen removal for (3), straining, gravity separation, and granular media filtration for (4), and chlorination, ozonation, heat, and gamma radiation for (5). These operations can be synthesized into a process to produce renovated waters for reuse at any given quality level. Proper operation sequencing with single and multiple pollutant removal capabilities will provide an optimum design for both the economic and process standpoint. CITY WASTE WATER REUSE FOR NUCLEAR POWER PLANT COOLING,
Arizona Public Service Corp., Phoenix.
A. C. Rogers.
In: Conference on Water Requirements for Lower Colorado River Basin Energy Needs, May 8-9, 1975, p 304-319. 5 fig, 5 ref.

Descriptors: *Water supply, *Water requirements, *Nuclear powerplants, *Waste water treatment, *Water reuse, Water utilization, Lime, P power production, Water resources, Econ Costs, Electric power, Energy, Cooling, Cooling towers, Arid lands, *Arizona, Wate servation, Recycling, Water quality, Bio treatment, Chlorination, Water treatment, tion, Calcium compounds, Magnesium pounds, Silica, Phosphates, Ammonia, Ni tion.
Identifiers: Phoenix(Ariz), Cold lime treatm

In using waste water for nuclear power plan ing it is important to maintain calcium, ma um, silica and phosphate at low levels fo condenser/cooling tower operation. A reduc ammonia is important because of potential sion of certain metal alloys and for reliabili cost effectiveness of the overall waste wate mation system. The effluent requires chlorination initially, a treatment step com biological nitrification to remove most of t monia, then a one or two stage cold lime ment. The two-stage lime treatment proce lime addition in the first clarifier at a high remove phosphate and calcium through for of calcium hydroxyapatite. This treatmen removes magnesium and silica. In the stage, the pH is lowered through the addi CO2, and soda ash which results in remo reasonably pure calsium carbonate which recovered to supplement the lime additio cost of the water after processing is estim be in excess of $100 per acre-foot. DESIGN CRITERIA--WASTE TREATMENT PLANTS AND TREATMENT OF SEWER OVERFLOW,
Environmental Protection Agency, Springfield, Ill.
W. L. Blaser.
Water Pollution Control Technical Policy 20-24, Illinois Environmental Protection Agency, Sanitary Water Board, July, 1971. 25 p, 1 fig, 2 tab.

Descriptors: *Legislation, *Overflow, *Sewers, Sewerage, *Treatment facilities, Combined sewers, Infiltration, *Design criteria, Separated sewers, *Waste water treatment, *Illinois.

Pursuant to authority granted in Section 39 of the Environmental Protection Act and in the Illinois Pollution Control Board Rules and Regulations the design criteria in the treatment of sewer overflows must meet the following requirements. All system bypasses and overflows that are not absolutely necessary shall be eliminated or alternate facilities provided to insure adequate treatment of the overflows. New combined sewers are prohibited and existing combined sewer systems shall be controlled with overflow regulating devices adjusted to convey the maximum amount of combined flow to the treatment facilities. All infiltration to the sewer system shall be controlled to keep dry weather flow at design limits. (Sandoski-FIRL)

SEWAGE PURIFICATION DEVICE (OSUI JOKA SOCHI),
K. Kuramoto, K. Yoshimura, Y. Hirakawa, and H. Matsumoto.
Japanese Patent Sho 47-12392. Applied March 29, 1967. Issued April 17, 1972.

Descriptors: *Sewage treatment, *Treatment facilities, *Patents, Aeration, Aerobic conditions, Chemical precipitation, Disinfection, *Aerobic treatment, *Waste water treatment.
Identifiers: Japan, *Aerobic digestion.

A sewage purification system consisting of an aeration tank, two precipitation tanks, an aerobic digestion tank, and a sterilization tank has been patented. One large outer tank is separated into two sections by a partition. One section is segmented further into two sections by double walls which do not cut off the two segments completely. One is the aeration tank, and the excess sludge from this part over- flows into the next section when it gets above a certain level; the connecting section is a precipitation tank. When the water level of the supernatant liquid from the second precipitation tank rises above a certain level, it overflows into the sterilization tank. By transferring excess sludge from the aeration tank into its precipitation tank, the sludge concentration of the aeration tank is always maintained at a given level, preventing any lowering of aeration tank functioning. SEWAGE SOLID SEPARATING DEVICE,
C. C. Laval, Jr.
Untied States Patent 3,701,425. Applied October 16, 1970. Issued October 31, 1972. Official Gazette of the United States Patent Office, Vol 903, No 5, p 1582, October 31, 1972.

Descriptors: *Sewage, *Solid wastes, *Separation techniques, Flow characteristics, *Patents, Equipment, *Waste water treatment.
Identifiers: Sewage solids, Sewage fluids.

A device for separating sewage solids from sewage fluids has been patented. The device is characterized by a variably dimensioned orifice for tangentially jetting a stream of fluid into a vortexing chamber supported in an upwardly spaced relationship with an accumulator for descending solids. A flexible closure member is extended across the orifice in the direction of the flow and is provided with a first surface against which fluids passing through the orifice impinge and a second surface against which fluids within the chamber impinge, whereby the effective dimensions of the orifice is varied in response to variations in the flow characteristics of the stream. W76-00772

PROCESS AND PLANT FOR TREATING SEWAGE AND THE LIKE,
K. C. Ayers, and D. W. McAnaney.
Canadian Patent 912,716. Applied April 30, 1970. Issued October 17, 1972. Patent Office Record, Vol 100, No 42, p 4379, October 17, 1972.

Descriptors: *Sewage, Trickling filters, Lagoons, *Patents, *Sewage treatment, Dissolved solids, Suspended solids, Activated sludge, *Waste water treatment.

A process for the treatment of liquid containing biodegradable organic solids, as for example sewage, which combines desirable features of trickling filter and activated sludge systems and includes suitable apparatus has been patented. In this process, a liquid containing biodegradable solids is constantly recirculated from a sump or aerobic lagoon through a trickling filter, and effluent from the trickling filter is mixed with incoming raw sewage with agitation in the sump. The mixture is then retained in quiescent zones before overflow effluent is removed from the sump thus efficiently treating both settleable solids and dissolved solids contained in the sewage. TUNNELING MAKES RIVERSIDE INTERCEPTOR FEASIBLE,
Black and Veatch, Kansas City, Mo.
W. R. Condon.
Public Works, Vol 103, No 11, p 70-72, 104, November, 1972. 3 fig.

Descriptors: *Tunneling, *Sewers, *Interceptor sewers, Drainage water, Construction methods, Soils, Dewatering, Missouri River, Treatment facilities, Tunneling, *Missouri.
Identifiers: *St. Joseph(Mo).

A riverside interceptor sewer, which parallels the Missouri River near the outlet of existing combined sewers, for the collection and treatment of dry-weather waste water flow was constructed in St. Joseph, Missouri. In this interceptor system the dry-weather flow in the sewers is intercepted and conveyed to a treatment plant. Tunneling was used in the interceptor program in conjunction with the wood box construction method. With this type of construction, a shaft is built at each turning point in the sewer alignment, at each line manhole, and at each diversion structure. A tunneling shield is lowered into a shaft and used to excavate along the sewer alignment. Much of the soil was accreted and contained a variety of materials, including sand, clay, gumbo, and trash, loose rock and wood. A portion of the sewer was constructed in sand below the level of the Missouri River, and extensive dewatering was required. (Sandoski-FIRL)

MOLE MUNCHES THROUGH 4 MILES OF HARD ROCK.
Engineering News Record, Vol 189, No 17, p 18-19, October 26, 1972. 3 fig.

Descriptors: *Tunnels, *Tunneling, Treatment facilities, Tunneling machines, New York.
Identifiers: New York City, North River Pollution Control Project(NY).

The New York City River Water Pollution Control Project includes 13 miles of tunnels with five tunnel sections, and a 220 mgd treatment plant. Tunneling methods include the conventional shoot and muck, cut and cover, tunnel boring machines (TBMs), working under air, freezing, and combinations of these. Two TBM moles are being used on the Project: one, an 11-foot diameter mole in the south heading of a four mile tunnel; and the other, an 8.5-foot diameter mole in the north heading. The moles cut through the rock with strengths to 30,000 psi. The gage cutter with a 1-inch round bolt carbide insert provides endurance, lasting through 1000 feet. The bolt inserts are placed around the outside of the cutter head. Cutter disks with button carbide inserts are placed around the center of the cutter head. The smooth finish climinates the need to concrete overbreak areas. (Sandoski-FIRL)
W76-00779

LOADER USED TO SPEED SEWER TUNNEL CONSTRUCTION.
Tunnels and Tunnelling, Vol 4, No 6, p 560, November/December, 1972. 2 fig.

Descriptors: *Tunnel construction, *Tunnels, Tunneling machines, Sewers, *Ohio.
Identifiers: Lucas County(Ohio).

A small four wheel drive skid-steer type Uniloader with a water-cooled diesel engine was used to speed sewer tunnel construction in Lucas County, Ohio. The old fashioned method of tunnel construction was used, the procedure consisting of drilling, shooting, mucking, and installing steel support rims and wooden lagging. Several modifications were made to better equip the Uni-loader for tunneling. A shovel point nose was fabricated onto a conventional bucket since a small loader pushing a standard half-yard bucket into heavy shot rock could be expected to have problems. A special steel box was rigged to the rear of the machine and loaded with 150 pounds of lead for extra counter weight. The air cleaner was replaced with an oil bath cleaner because of the dirty underground conditions. The diesel engine was equipped with a special scrubber-type catalytic muffler designed to reduce the amount of noxious gases emitted. The Uni-loader was used to carry rock, dynamite, drills, steel ribs and laggings, and concrete for the construction of a floor to maintain the pipeline at grade. (Sandoski-FIRL)

Identifiers: Moscow, U.S.S.R., Vazuza River.

Extensions and implementations are planned for the water supply and sewer system of Moscow to provide for the increasing population and water resource deficit. A 2% increase of water supply is anticipated for the coming years. The daily water supply is projected at 4.4 million cubic meters in 1975, 5.3 million in 1985, and 7 million by 2000, with 30% assigned for industrial and air conditioning purposes. Industries will be forced to focus on developing water recycling methods. A new water reservoir is under construction on the Vazuaz River and is expected to provide 1.7 million cubic meters of water daily. To prevent contamination of the surface reservoirs within the metropolitan area, the separate canal networks will be converted into a unitary system handling both the sewage and runoff waters; an aeration system with a daily capacity of one million cubic meters will also be provided. Descriptors: *Waste water treatment, *Pipe Biological treatment, Biochemical oxyge mand, Activated sludge, Water reuse, Aerati
Identifiers: Pressure pipe treatment, A sludge.

Waste water treatment within a pressure p shows promise of producing better than 90% removals, with costs at 40% less than a c tional secondary treatment and recla system. The pressure pipe treatment (PPT) provides both transportation and treatment pipeline used to deliver the reclaimed water point of reuse. Biological treatment occurs pipeline by a modification of the conventio tivated sludge process. The introduction of pure oxygen in the pipeline maintains the ne ry dissolved oxygen for the process. Ac sludge, removed at the upstream end pipeline, returns to the downstream and sewer. The system is composed of influen works, primary sludge separation, an sludge activator, a wet well, an air compre PPT pipeline, a sludge removal process processing, and reclaimed water distri (Sandoski-FIRL)

WASTE DISPOSAL METHOD,
T. A. Nevin, and D. D. Woodbridge.
Canadian Patent 914,810. Applied September 3, 1969. Issued November 14, 1972. Patent Office Record, Vol 100, No 46, p 4774, November 14, 1972.

Descriptors: *Waste water treatment, Effluents, *Water reuse, Water supply, Sewage, Sewage treatment, Slurries, Sludge, *Patents, Waste disposal.
Identifiers: Ammonia removal, Methane removal, Lipid removal.

A patent has been assigned to Energy Systems, Incorporated of Melbourne, Florida for a waste treatment method of sewage and other liquid wastes in which the final effluent is adaptable for immediate reuse in a water supply system. Raw sewage is screened and the grit removed prior to mixing the sewage into a more uniform slurry. The slurry is processed to remove ammonia, methane, and acid insoluble lipids. The defatted, methane free slurry then has the sludge concentrated for further processing, soil enrichment or burning while the effluent is paaed through a series of different processes for removing various harmful or useful materials. This series of processes significantly includes the adapting of chemostats for usage in water treatment. Finally the effluent is prefiltered, passed through a radiation sterilizer, then a polishing filter, for reuse in a water supply system. (Sandoski-FIRL)

ROCHESTER'S STORMWATER DRAINAGE,
Humphreys (Howard) and Sons, London (England).
A. J. Ross-Smith.
Surveyor, Vol 140, No 4201, p 26-29, December 15, 1972. 6 fig.

Descriptors: *Floods, *Sewerage, *Sewers, Runoff, Drainage systems, Separated sewers, Infiltration, Flood control, Surface drainage, Urban runoff, Waste water treatment.
Identifiers: Rochester, England, Medway River.

The established city of Rochester, England is divided by the River Medway into two drainage areas which have been subjected to periodic flooding. In more recently developed areas, drainage is on the separate system yet during storms excess runoff infiltrates the older parts of the city causing flooding in low-lying areas. To alleviate this constant problem, the city council in 1963 financed a report on the city's surface water drainage system including necessary works to prevent flooding. It was recommended that a separate surface water system supplement or replace the existing sewers. As total redevelopment takes place over the years, the existing partially separate system will be replaced by completely separate sanitary and surface water sewers. (Sandoski-FIRL)

OAKLAND MAPS PROGRAM TO COMBAT SEWER INFILTRATION,
California State Dept. of Public Works, Oakland.
J. E. McCarty.
Public Works, Vol 104, No 2, p 82-83, February, 1973. 3 fig.

Descriptors: *Sewers, *Maps, *Maintenance, Cleaning, Equipment, Maintenance costs, Infiltration, *California, Waste water treatment.
Identifiers: *Oakland(Calif), *Sewer surveillance maps.

Development of a sewer surveillance map procedure and a preventive maintenance program based on use of modern sewer cleaning equipment have cut the sewer cleaning call rate from 50 to three calls per week in the northeast sector of Oakland, California. Using city maps for this program, every main is plotted, numbered, and scheduled for cleaning at least once a year. In areas where eucalyptus trees abound, which cause 90 percent of the stoppages, two cleanings per year are scheduled. In addition to mechanical and hydraulic cleaning, the area is chemically treated once a year by a flood and hold method applied one month prior to the scheduled rodding. The control reports coupled with the surveillance maps indicate that maintenance costs average 4.5 cents per foot of sewer. (Sandosli-FIRL)
W76-00792

NOMOGRAMS FOR SEARCH OF SYMBOLS PU AND TU OF STORM OVERFLOW IN A MIXING CONDUIT (NOMOGRAMME ZUR EMITTLUNG VON PU UND TU EINES RECENUEBERLAUFS DES MISCHWASSERKANALS),
H. Sold.
Wasser und Boden, Vol 24, No 9, p 312-315, 1972. 4 fig, 3 ref.

Descriptors: *Sewerage, Combined sewers, *Storm runoff, Water levels.
Identifiers: *Nomograms, West Germany, *Storm overflows.

Nomograms for searching optimum values of the water level, tu, and have weir crest height, pu, for the end of storm overflows in mixed sewer systems have been developed according to the preliminary guidelines of the West Germany Waste Water Association. The nomograms were elaborated for one storm overflow length, seven flow reducer section dimensions, eight reducer section slopes, and one pipe surface roughness. Optimum values of tu and pu, of the load capacity of the reducer section, the reducer diameter, bed slope, and of the storm overflow length are found in the nomogram as a function of the acceptable overload caused by the storm runoff in the outgoing sewer system. SEWER OVERFLOW - EVALUATION OF MODEL TEST AND USE IN SEWER TECHNIQUE (REGENUEBERLAEUFE - EINE AUSWERTUNG VON MODELLVERSUCHEN MIT ANWENDUNG AUF DIE KANALISATION-STECHNIK),
K-C. Taubmann.
Gas Wasser Abwasser, Vol 52, No 10, p 297-308, 1972. 17 fig, 2 tab, 5 ref.

Descriptors: *Model studies, Sewerage, *Sewers, *Overflow, Weirs, Overfalls, Separated sewers.
Identifiers: *Switzerland, Hydraulic range.

Model tests of different types of sewer overflow to define their hydraulic range of application are discussed. These tests were carried out at the Laboratory of Hydraulic and Earthwork Engineering, Technical University of Zurich. Results for separate sewage systems indicate that the usual weir can only be recommended for the range of small base fall of mixed water inflow. A weir with an overfall and a following throttle section can be used in the transition region between a current and flowing water. For the range of big base fall, a leaping weir is recommended. The leaping weir was tested systematically. Using detailed model tests, the common calculation method can be enlarged and improved, especially for soil opening geometry and separate sewers. THE OPERATION SYSTEM OF URBAN SEWERAGE TREATMENT (TOSHI GESUISHORIJO NO OPERESHON SHISUTEMU NI TSUITE),
Fuji Electric Co. Ltd., Tokyo (Japan).
Y. Ito.
Kankyo Sozo, (Environmental Creation) Vol 2, No 10, p 45-52, October, 1972. 7 fig.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Control systems, Operation and maintenance, *Sewage treatment, *Treatment facilities, *Waste water treatment.
Identifiers: *Japan.

The systems operation of an urban sewage treatment plant in Japan involves taking various measurements at each treatment plant and directly sending them to a control room, with data at distant pumps and rivers being sent by telemeters. The control room consists of a monitoring room, a calculator room, and an electric panel console room. The collected data are handled by a computer and the results transmitted directly as control orders to operators, relay panels, sequences for operating pumps, receivers, gates, and valves. Transmitter pumps are operated by telecommunication remote control. Industrial television monitors the conditions of each treatment plant, and the data are recorded generating alarm signals on the operation guide which automatically initiates necessary action. As supplementary apparatus, television and slide displays, an audio stem, typewriters, and trend recorders are used. (Sandoski-FIRL)

ELECTRONIC COMPUTATION OF QUANTITIES AND COSTS FOR SEWERAGE SYSTEMS CONSTRUCTION (MASSENERMITTLUNG UND KOSTENBERECHNUNG IM KANALISATIONSBAU MIT ELEKTRONISCHEN DATENVERARBEITUNGSANLAGEN),
G. Euler, R. Golueke, K. Lerch, and K. J. Ueker.
Wasser und Boden, Vol 24, No 10, p 307-311, 1972. 7 tab.

Descriptors: *Sewerage, *Construction, *Estimated costs, Cost analysis, Construction materials, Automation, Computer programs, Operating costs, Waste water treatment.

A procedure for the electronic computation of quantities and costs for construction of sewerage systems used for cost estimates, dispositions, and the determination of standing values of existing sewerage systems, has been developed. Materials and job costs, type of soil and trench, groundwater level, pipe diameter, bedding conditions, and type of sheet piling are among the input data. Per-meter prices of materials and individual jobs are computed from the output data contained on three data lists and these unit prices are then integrated for a given sewer section. (Sandoski-FIRL)

SEWERAGE DRAINS MADE OF PLASTIC PIPES (KANALISATION MIT KUNSTSTOFFROHREN),.
Wasser, Luft und Betrieb, Vol 16, No 10, p 363-364, 1972.

Descriptors: *Pipelines, Pipes, *Plastic pipes, Construction materials, *Sewers, Waste water treatment.
Identifiers: *Polyvinyl chloride.

Nordrohr type sewer and drain pipes, made of high-density PVC 100 according to DIN 8061 Standards and used in constructing sewer systems, are resistent to most common chemicals; yet pipes with a nominal diameter of 100-200 mm should not be permanently exposed to wastewater with temperature exceeding 60C, and those with a diameter of 250-500 mm to temperatures higher than 40C. Unlike pipes with a diameter of 100-200 mm, those with diameters larger than 250 mm should be laid in a straight line and free of tension. It is possible to combine PVC with pipes made of other materials such as cast iron or stoneware. (Sandoski-FIRL.)

MICROWAVE SEWAGE SYSTEM WITH DISTILLATION MEANS,
Koehler-Dayton, Inc., Dayton, Ohio. (Assignee).
A. H. Cornish, R. C. Helke, A. N. LeDonne, and H. Masters.
United States Patent 3,700,565. Applied April 3, 1970. Issued October 24, 1972. Official Gazette of the United States Patent Office, Vol 903, No 4, p 1368, October 24, 1972.

Descriptors: **Sewerage, *Microwaves, Evaporation, *Patents, Sewage treatment, *Waste water treatment.
Identifiers: Vaporization, Sewage receiving tanks, Evaporation tank.

A self-contained sewage system has been patented in which a microwave energy source is provided to vaporize the liquid phase of the sewage so that it may be removed from the system and the interval between servicings of the system lengthened. The sewage is transferred from the sewage receiving tank to an evaporating tank for evaporation and, in certain embodiments used in situations where power is not at a premium, a portion of the liquid vaporized from the sewage may be returned to the system for flushing purposes. THE TREATMENT OF RAIN WATER. RAIN OVERFLOW, RAIN OVERFLOW BASINS, RAIN PURIFICATION TANKS, RAIN CATCHMENT BASINS (DIE BEHANDLUNG DE REGENWASSERS),
K. Krauth.
Technische Mitteilungen, Vol 65, No 9, p 445-540, September, 1972. 10 fig, 19 ref.

Descriptors: *Rainfall-runoff relationships, *Sewerage, Overflow, Sewers, Overland flow, Flow duration, Design, Combined sewers, Separated sewers, Treatment facilities, *Waste water treatment.
Identifiers: Germany.

General characteristics of rainfall runoff and design criteria of rain overflows, rain overflow basins, purification tanks, and rain catchment basins are described. The maximum contaminant concentration of effluents from a combined sewer system is reached when rinsing of the sewer at a flow rate of 0.5-0.6 m/sec commences. Runoff carries 67% of the BOD5-load and 83% of the unsolved matter during the first half of the rainfall duration. Separate sewer systems carry smaller contaminant loads during rainfall, except for the initial period of runoff. Formulae for the calculation of the sewage runoff with and without rainfall, and for the critical runoff for combined sewer systems are mentioned with regard to criteria for design purposes. Design criteria of various overflows for critical combined water runoff include the following: (1) an overflow canal with one- or two-sided weirs (flow cross-section height of 20 cm) that leads into a 3- to 5-cm deeper sewer channel; (2) an overflow channel having a spring opening in the bottom (Approximately 50 cm in length to prevent clogging) through which the excess runoff passes; (3) an overflow channel with horizontal separating plates used for large-capacity sewer systems; and (4) a controlled overflow channel in which a flow height measuring instrument and an electric valve regulate the inflow to the purification plant and stabilize the maximum load of the facility. ELECTROLYTIC WATER TESTER-FO DETERMINATION OF OXYDANT OR REDU ING AGENT CONTENT.
Belgian Patent 800,283. Issued November 1973. Derwent Belgian Patents, January 31, 1974

Descriptors: Equipment, *Paten *Instrumentation, Treatment methods, *Wa treatment, *Waste water treatment, Cont systems, Electrolysis.
Identifiers: *Electrolytic water tester.

An electrolytic water tester for the determinati of oxydant or reducing agent content is describ It consists of an outer shell with an insulating p at one end to support a reference. An indicat electrode is at the other end and has the conne ing leads from those electrodes passing out of The electrode probe is placed within a flow of water to be analyzed at the axis of flow. The dicator electrode is of precious metal (platinum gold) and the reference electrode a metal w (silver or copper); the two electrodes are conc tric and have a longer life than probes us calomel as electrode material. The tester is es cially used for control information and signals determine or regulate rate of addition of neutral ing agent in water treatment plants. (Merritt-FIR W76-00841

ACTIVATED SLUDGE SEWAGE TREATER.
German Patent 2,043,148. Issued November 1973. German Patents Abstracts, Vol U, No 48 2, January, 1974.

Descriptors: *Patents, Treatment metho Sewage, *Sewage treatment, *Activated slud Aeration, Equipment, Hydraulic equipme *Waste water treatment.

An activated sludge sewage treater is describ which has at least one baffle extending transver ly of the longitudinal flow in the annular clos aeration tank. The baffle top edge is below water level, and the baffle is inclined downwa toward the flow to deflect part of it. Preferably tank has two straight sections joined by curv ones. The aerator is in a curved section at the e of the partition separating the straight sectio The baffle is at the beginning of the straight s tion downstream of the aerator. (Merritt-FIRL) W76-00842

METHOD OF FILTRATION.
Australian Patent 441,682. Issued November 1973. The Australian Official Journal of Paten Trade Marks and Designs, Vol 43, No 42, p 44 November 8, 1973.

Descriptors: *Patents, *Treatment metho *Filtration, *Water treatment, Municipal wat *Waste water treatment, Hydraulic equipment.

An improved hyperfiltration process is describ for purifying water by removing solute impurit from an aqueous solution. An inert non-solute jecting filter aid material is deposited to a b depth of from 0.1 to 100 microns on a porous st strate which contains pores large enough to all water to pass through. The material has a parti size in the range of 0.01 to 100 microns. The so tion is passed over the surface of the bed in cr flow to form a solute- rejecting membrane of

l on the bed. A sufficient velocity and pres-
pp is maintained across the bed to force the
through and to allow the filtered material
ct. (Merritt-FIRL)

NT WATER TREATMENT,
ch.

French Patent 2184-917. Issued February 1, 1974.
French Patents Abstracts, Vol. 5, No. 11, February, 1974.

Descriptors: *Patents, *Effluents, Salts, Water quality, *Waste water treatment, *Sludge treatment.
Identifiers: Chlorisocyanuric acid, Na aluminate, NaOH, Na tripolyphosphate, Oil emulsions, Humic acid colloids, Chemical processes.

Effluent water is treated with an agent consisting of (a) chlorisocyanuric acid or salts of this, (b) Na aluminate, (c) NaOH (d) Na tripolyphosphate or Na hexametaphosphate and Mg sulphate or Mg chloride or Mg oxide. The agents, when added to contaminated water containing fats, or oil emulsions, of humic acid colloids, give excellent proportion of the impurities and purification of the water. The process is especially effective with oil emulsions if the treated water is also subjected to an electric field between two electrodes to give a rapid proportion of the oil as a sludge. (Prague-FIRL)
W76-00849

ACTIVATED SLUDGE PURIFICATION STATION FOR WASTE WATER AND SEWAGE TREATMENT,
French Patent 2187-705. Issued February 22, 1974.
French Patents Abstracts, Vol. 5, No. 11, p 6, February, 1974.

Descriptors: *Patents, *Activated sludge, *Waste water treatment, *Sewage treatment, Stations, Water purification, Injection, Equipment, Tanks.

The station consists of a tank in the form of a body or revolution, with a horizontal axis and is divided internally by partitions which form the boundaries of a primary settlement chamber. The partitions also form, with the end walls, two volumes, one of which acts as a secondary settlement chamber. An injection chimney for the activated sludge has its lower, bell-mouthed end provided with an air nozzle to keep the liquid rising in the chimney. The upper part of the secondary settlement chamber includes an undisturbed filtration area, with an outlet for the purified water. The incoming sewage is seeded immediately in the injection chimney and is mixed with the stream of activated sludge; any abnormal flows can be dealt with satisfactorily. (Prague-FIRL)
W76-00851

WASTE WATER TREATMENT CHEMICAL REACTOR,
French Patent 2187-398. Issued February 22, 1974.
French Patent Abstracts, Vol. 5, No. 11, p 5, February, 1974.

Descriptors: *Patents, *Waste water treatment, Chemical reactions, Pressure, Power, Lime, Equipment, Hydrogen ion concentration, Hydrogen sulfide.
Identifiers: *Chemical reactors.

The reactor, separated by a perforated partition from an overhead 'plug flow' reaction chamber, has a bottom inlet below a convergent/divergent blending nozzle. The throat is fed a reagent, such as a coagulant or a flocculant. The reactor has a low pressure drop (.2-.5 bar), low power requirement, reduced dead space, and is not subject to by-passing reaction. It may be controlled in response to sensors (pH detectors) in upper and lower chambers. The reactor is especially useful for treatment of waste water, such as with lime or H_2SO_4 to control pH. (Prague-FIRL)
W76-00852

CONTINUOUS SEEDING AND ACTIVATING DEVICE.
French Patent 2190-742. Issued March 8, 1974.
French Patents Abstracts, Vol. 5, No. 13, p 6, March, 1974.

Descriptors: *Patents, *Septic tanks, Activation, Effluents, Equipment, *Waste water treatment.
Identifiers: Culture media, Activating devices, Biological purification.

A seeding and activating device for septic tanks consists of a cylindrical recipient with a movable, inclined cover with holes acting as a strainer. The device is placed below the pipe which feeds the effluents into the tank; it is fixed to this pipe or to the wall of the tank and dips into the liquid layer. The recipient is fitted with an overflow pipe. The culture medium in the device can be fed with fresh organisms and natural nutritive substances which are added as required. At the same time a certain amount of mixing and agitation is effected in the culture medium itself. (Prague-FIRL)
W76-00853

FLOATING MIXER FOR WASTE WATER TREATMENT TANK,
French Patent 2187-399. Issued February 22, 1974.
French Patent Abstracts, Vol. 5, No. 11, p 5, February, 1974.

Descriptors: *Patents, *Waste water treatment, *Liquids, Mixing, Tanks, Equipment, Tubes.
Identifiers: Floating mixer, *Mixers.

A float filled with foamed polyurethane, carries an electric motor, and is tethered by cables on the surface of a tank for waste water treatment. The motor drives a helical impeller, shrouded by vertical cylindro-conic tube; flow may be upward or downward. It is deflected radially by a baffle, formed by the bottom of the float, or by a cone in line with bottom of shroud. The motor is protected from liquid by an intercepting plate at bottom of float through which the shaft passes; leakage between shaft and interceptor is returned to the tank by horizontal radial channels through a float. The liquid level maintained above interceptors prevents air entrainment and consequent cavitation at the impeller when flow is downwards. The mixer automatically adjusts to level of the tank liquid and is easily relocated or removed from cleaning. (Prague-FIRL)
W76-00854

SEWAGE DISPOSAL,
E. J. McCrink.
French Patent 2190-738. Issued March 8, 1974.
French Patents Abstracts Vol. 5, No. 13, p 6, March, 1974.

Descriptors: *Patents, *Sewage disposal, *Solid wastes, *Liquid wastes, Distillation, Sewage, *Waste disposal, Tanks, Waste water treatment, *Sewage treatment.
Identifiers: Settling tanks.

Liquid and solid waste materials of sewage are allowed to separate in a settling tank. The solids are removed and are heated in a non-oxidizing atmosphere to the point of destructive distillation. The gaseous products are treated by passing them through a flame curtain to remove any noxious odors. The final product is a finely powdered ash which may be removed and easily disposed. (Prague-FIRL)
W76-00855

ANAEROBIC EFFLUENT TREATMENT,
B. V. Stamicarbon.
Belgian Patent 803-949. Issued February 25, 1974.
Derwent Belgian Patents Reports, Vol. 5, No. 11, p 1, April 18, 1974.

Descriptors: *Patents, *Sludge, Tanks, Flow, Microbiology, Effluent treatment, Anaerobic conditions, Water purification, *Denitrification, Sludge disposal, Waste treatment.
Identifiers: *Microbiological purification, Anaerobic purification.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Anaerobic microbiological purification of effluent is supplied tangentially to a rotationally symmetrical purification tank containing a microbiological sludge, by introducing the effluent below the surface of the water through greater or greater than 1 device. The outermost of these lies at a distance from the edge of the tank corresponding to 0.5-1.0 times the height of the water, at a velocity such that the tangential flow velocity at any point in the tank is 0.5-2 m/sec and more especially 0.2-1 m/sec. The water containing the micro-biological sludge is discharged after residence in the tank through an opening in or near the center of the tank. (Prague-FIRL)
W76-00856

METHOD AND APPARATUS FOR TREATING SEWAGE,
H. Brociner.
Canadian Patent 944,089. Issued March 19, 1974. Patents/Brevets, Vol. 102, No. 12, p 1057, March, 1974.

Descriptors: *Patents, *Solids, *Sewage, *Sewage treatment, Streams, Effluents, Equipment, Canada, Flow, Liquids, Weirs, Solid wastes, Separation techniques, Waste water treatment.
Identifiers: Effluent sewage, Heavy solids.

Elimination of heavy solids, such as grit, from sewage streams prior to introduction into treatment tanks is necessary as such solids interfere with normal operations. Substantially all of the heavy solids are removed by a process and apparatus where raw sewage is introduced into a tank with the bottom sloping downwardly from the far side to a trough adjacent a first sidewall, with even distribution along the first sidewall. A predetermined small range of liquid level variation is maintained by flowing effluent sewage over a weir extending above the full length of the top of the sidewall opposite the first sidewall. Air is introduced with even distribution through and along the first sidewall to induce circulatory flow of liquid and light-weight solids upwardly and then in the direction of the opposite sidewall. This turns the circulatory flow direction downwardly toward the tank floor by a baffle spaced from the opposite sidewall and positioned transferse to the direction of liquid flow through the tank, to effect separation of light-weight solids and flowing the sewage suspension under the baffle and upwardly for removal by flow over the weir. SEWAGE PURIFIER WITH DROP BODY AND SUMP TROUGH FOR ACTIVATED SLUDGE.
German Patent 2028047. Issued March 21, 1974. German Patents Abstracts, Vol 5 No 7, p 2, March, 1974.

Descriptors: *Patents, *Sewage, *Water purification, *Activated sludge, Sumps, *Sewage treatment, *Waste water treatment.
Identifiers: *Sewage purification, Central mixing zone, Settling zone, Sump trough, Drop body.

A central mixing zone is bounded by walls reaching on all sides above the liquid surface in the trough. It extends out from into the trough, from the settling zone between these walls and the inner side of the trough's bounding wall. The raw sewage inlet ducts, the drop body drain, and the branch duct for the returned settled sludge and liquid open into the mixing zone. The settling zone is divided into separate zones to interrupt the horizontal movement of liquid. (Prague-FIRL)
W76-00858

BIOLOGICAL PURIFICATION OF SEWAGE,
French Patent 2190-739. Issued March 8, 1974. French Patents Abstracts, Vol 5, No 13, p 6, March, 1974.

Descriptors. *Patents, *Sewage, Biological treatment, Reservoirs, Sewage water, Anaerobic conditions, Nitrates, Clarification, *Sewage treatment, Waste water treatment
Identifiers: *Biological purification, Feed reservoirs, Aerobic treatment.

Purification is carried out using three reservoirs of which greater or equal to 2 serve as feed reservoirs for the sewage water, and one as a clarification reservoir. The sewage water in the first feed reservoir is circulated aerobically for part of the time and anaerobically for the rest of the time. It is then discharged to the clarifying reservoir through the third reservoir where it has aerobic treatment. The feed reservoir may be connected to the clarifying reservoir directly during its aerobic period, and to the third reservoir during its anaerobic period. The functions of the two feed reservoirs are changed over periodically. Precipitation takes place in the presence of inorganic compounds, in particular of nitrates, which may be produced. (Prague-FIRL)
W76-00859

BIOLOGICAL SEWAGE TREATMENT PLANT WITH CENTRIFUGAL AERATOR AT WATER SURFACE,
German Patnet 1759861. Issued March 21, 1974. German Patents Abstracts, Vol 5, No 7, p 1, March, 1974.

Descriptors: *Sewage treatment, *Patents, *Biological treatment, *Treatment plants, Channels, Tanks, *Waste water treatment, Oxidation.
Identifiers: Oxidation tank, Biological sewage treatment plant, Sewage flow, Aerators.

A partition between two straight troughts forming the oxidation tank reaches solely up to the aerator/circulator, which rotates about a vertical axis at one of the curved sections connecting the troughs. The partition is curved near the aerator twoard the channel side in which the sewage flows down toward the aerator. (Prague-FIRL)

ASSESSING A MARSH ENVIRONMENT FOR WASTEWATER RENOVATION,
Agricultural Research Center, Fort Lauderdale, Fla.
K. K. Steward, and W. H. Ornes.
Journal Water Pollution Control Federation, Vol. 47, No. 7, p 1880-1891, July 1975. 7 fig, 6 tab, 28 ref.

Descriptors: *Reclaimed water, *Water reuse, *Marshes, *Florida, Marsh plants, Soils, Nutrients, Waste water(Pollution), Plant physiology, Nutrient requirements, Physiological ecology, Plant growth, Nitrogen, Phosphorus, Potassium.
Identifiers: *Everglades National Park.

Experiments were conducted in situ on isolated plots in a marsh to assess the capability of the system for renovating wastewater. Artificial enrichment of sawgrass did not produce increased growth even though nutrients were assimilated. Thus, growth was not nutrient limited. Weekly applications of 2.2 kg/ha of phosphorus increased tissue levels fivefold after 22 wk. However, this increase represented only 12% of the amount applied. The marsh system seems to have a limited capacity for assimilating nutrients. This capacity was stressed after 3 wk and overloaded by 8 wk at a continuous rate of enrichment. Because of this capacity for nutrient absorption, it was unlikely that sawgrass plants could be used to renovate wastewater efficiently with high nutrient concentrations. (Sims-ISWS)

SOCIAL, LEGAL, AND ECONOMIC
SIDERATIONS OF ANIMAL PRODUCTI
URBANIZED AREAS,
A. Aust.

Second National Symposium on Poultry Indus-
Waste Management, University of Nebraska,
coln, May 19-20, 1964, p. 225-240.

scriptors: *Poultry, *Management, *Legal
ects, *Social aspects, *Economics,
banization, Water pollution sources.

hin the last forty years, our country has un-
gone extensive urbanization. The poultry
ner or industrialist must face the ever growing
anization of our society to effectively function
he world of today and tomorrow. There are
e social developments which have been accen-
ed by urbanization that restricts the location of
nal processing plants. These are: (1) the growth
large concentrations of people crowded
ether; (2) the tremendous technological ad-
ces of our society; and (3) the growing af-
nce, education, and cultural sophistication of
society. Because of these social changes many
l developments have taken place in the past
years. New legal restrictions or controls on
animal industry usually fall into four main
gories: (1) planning controls; (2) public health
trols; (3) public safety codes; and (4) aesthetic
trols. Closely related to social and legal
elopments are the economic considerations af-
ing the locating of new processing plants and
operation of existing plants. There are three
rses of action open to the poultry industrialist
erms of economics. These are: (1) the laissez-
e or do-nothing approach; (2) the self-sufficient
roach; and (3) the good citizen approach. The
d citizen approach is economically the best ap-
ach to the poultry man. (Russell-East Central)

ste storage, *Waste treatment, Odor.

oor' and 'outdoor' 'lagooning' are two
ods often employed by poultry farmers for
e storage and treatment. With either type, the
tryman fights an odor problem. To prevent
and to beneficially handle manure, the
try man should catch manure in waterproof
s; keep it covered with water at all times;
e it out before it settles down; either haul it
spread it on crops or stabilize it in an outdoor
on; and move wastes by gravity. The author
icts that present and future research will solve
y of the current lagoon odor, decomposition,
pollution problems. (Russell-East Central)

ge, *Waste treatment, *Waste disposal,
ycling, Oxidation lagoons, Lagoons,
dration, Hydraulic equipment, Fertilizers.
ifiers: *Waste management, *Land spread-
Refeeding.

Some poultrymen have deep pits to hold the waste until it can be spread on land. These pits must be kept reasonably dry and must be cleaned at least once a year. Another system is the hydraulic system in which the droppings are pushed out by water pressure into a storage facility. Waste then must be placed in an aerobic lagoon to prevent odors. Some men use oxidation ditches. Some attempt storage for long periods of time. As a general rule, waste must eventually be spread on land. Recently, dehydration and recycling as feed has gained attention. Price has been the discouraging factor in dehydration, and only about 10% of the waste can be recycled as feed, leaving the rest to be disposed of by some other method. (Russell-East Central)

STATE OF WISCONSIN V. MICHELS PIPELINE CONSTRUCTION, INC. (ACTION FOR AN ORDER TO CONSTRUCT SEWER SO AS NOT TO CREATE A NUISANCE TO NEIGHBORING LANDOWNERS).
217 N.W.2d 339 (Wis 1974).

Descriptors: *Groundwater availability, *Sewage disposal, *Wisconsin, *Sewage, Judicial decisions, Wastes, Sanitary engineering, Water quality control, Waste disposal, Groundwater resources, Ground water, Water supply, Water table, Subsurface waters, Water pollution.
Identifiers: *Public use, *Nuisance(Water law).

An action was brought seeking an order directing the defendents to conduct construction of a sewer so as not to create a public nuisance. The plaintiff alleged that the defenants undertook construction of the sewer with knowledge that dewatering of the soil would lower the groundwater table from which area residents drew water. The court held that a possessor of land who withdraws groundwater from the land and uses it for a beneficial purpose is not subject to liability for interference with the use of water by another, unless the withdrawal causes unreasonable harm through lowering the watertable. SOUTHWESTERN STOCKHOLM REGIONAL TREATMENT SYSTEM,
Southwestern Stockholm Regional Water and Sewerage Works, Inc. (Sweden).
A. Cronstrom.
J Water Pollut Control Fed, Vol 45, No 8, p 1783-1788, 1973, Illus.

Descriptors: *Waste water treatment, Sweden.
Identifiers: Lake Malareu(Sweden), Himmerfjarden Bay(Sweden).

In 1963, the Court of Water Law passed a ruling that established guidelines for sewerage planning in the greater Stockholm area of Sweden. The ruling required that all wastewater treatment shall maintain a biochemical O2 demand removal of 95% during normal operating periods; existing combined sewers shall be reconstructed as separate systems; Lake Malaren, the freshwater source for the area, shall ultimately be relieved of all sewerage outlets; and the discharge of nutrients shall be limited by providing the best technique of treatment. To meet the demands of the ruling, an interregional system was proposed. All wastewater will be collected in a central system and treated at an activated sludge plant before discharge to Himmerfjarden Bay on the Baltic Sea.--Copyright 1974, Biological Abstracts, Inc.

5E. Ultimate Disposal Of Wastes

ENVIRONMENTAL SURVEY OF TWO INTERIM DUMPSITES-MIDDLE ATLANTIC BIGHT. SUPPLEMENTAL REPORT.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-239 257, $5.25 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA 903/9-74-010B, October, 1974. 105 p, 30 fig, 6 tab, 28 ref. D. H. Lear, editor.

Descriptors: *Water pollution effects, *Waste disposal, *Oceans, Environmental effects, Surveys, Benthic fauna, Iron, Heavy metals, Cadmium, Mollusks, Zooplankton, Ultimate disposal, Atlantic Ocean.
Identifiers: *Ocean dumping, Vanadium, Atlantic Bight.

Supplemental data from an environmental survey of two interim dumpsites in the Mid-Atlantic Bight are reported. Dissolved and particulate organic carbon accumulations were not found in the water column studied. Dissolved and particulate organic carbon accumulations are probably dependent on time of latest release and are also a cumulative function of time. No patterns of distribution in the water column were observed for particulate and dissolved iron, in spite of the weak themocline. Statistical treatment of the data shows that metals disposed of in the oceans accumulate in the tissue of benthic organisms in quantities roughly proportional to the amounts dumped, that certain metals, such as vanadium and cadmium, are dumped in such quantities in one of the two studies such that they may be used as tracers for that dumpsite, and that the effects of these dumped materials are spread over a large undetermined area. Zooplankton populations at the sample locations showed no effects of stress. (Orr-FIRL)

LIBRARY U. OF I. URBANA-CHAMPAIGN

INCENERATOR FOR RAW SEWAGE,
Morse Boulger, Inc., Flushing, N.Y. (Assignee).
C. M. Mainka, and G. A. Nash.
United States Patent 3,896,745. Issued July 29, 1975. Official Gazette of the United States Patent Office, Vol 936, No 5, p 1647, July, 1975. 1 fig.

Descriptors: *Patents, *Sewage disposal, *Incineration, Waste disposal, *Waste treatment.
Identifiers: *Incinerators.

A patent was granted for an incinerator for the thermal disposal of raw sewage. The housing consists of: a primary combustion chamber, a secondary combustion chamber, and a mixing chamber connecting the primary and secondary combustion chambers. A burner is mounted on the housing, and includes means for injecting a flame through the primary combustion chamber, toward the mixing chamber. There the flame functions to ignite waste material, producing combustion gases. Any liquid constituents of the waste material are vaporized, and an induced draft is produced in the primary combustion chamber. This causes the flow of combustion gases and vapor toward and through the mixing chamber, into the secondary combustion chamber. There the mixture is ignited for secondary combustion. A flue mounted on the housing conducts residual combustion gases from the secondary combustion chamber into the ambient atmosphere. (Kramer-FIRL)

COUNTER-FLOW SLUDGE BURNER,
J. E. Hanway, Jr.
Canadian Patent 973,018. Issued August 19, 1975. Patent Office Record, Vol 103, No 33, p 26, August 19, 1975.

Descriptors: *Sludge treatment, *Sludge disposal, *Incineration, *Combustion, *Patents, Equipment, Ultimate disposal, Oil, Pumping, Temperature, Waste treatment.

An incineration method for sewage sludge has been patented. The dewatered sludge is dispersed downwardly in an upwardly flowing atmosphere within a firebox where the temperature is maintained high enough to dry and burn the sludge while it is falling. The ash and other products of combustion move upwardly to a gas scrubber and ash separator; relatively clean gas is discharged to the atmosphere. The firebox is preheated by a burner at the bottom of the box. Further burning of fuel at this burner or addition to the sludge feed is performed as required to maintain the necessary temperature. Addition of fuel oil to the sludge before pumping the sludge facilitates pumping, and achieves mixing. Supplementary air is fed in somewhat tangentially at the bottom to impart rotation to the gases within the firebox. (Orr-FIRL)

SEPTIC TANKS,
Carlson (Andrew) and Sons, Inc. Kings Park, N. Y. (Assignee).
A. L. Carlson, and J. R. Pinezich.
United States Patent 3,898,162. Issued August 5, 1975. Official Gazette of the United States Patent Office, Vol 937, No 1, p 202-203, August, 1975. 1 fig.

Descriptors: *Patents, *Sewage disposal, *Waste disposal, *Septic tanks, Equipment.

A patent has been issued for a method of sewage disposal. The system consists of a leaching pool having a wall with effluent slots and a frusto-conical dome atop the wall which forms the top and sides of a concave-convex bowl-shaped septic tank. This tank is located below the level of the top of the leaching pool wall and has a peripheral flange held by the leaching pool wall top and the dome. The flange supports the septic tank in the upper part of the pool, and the septic tank extends only part of the way down into the leaching pool and is provided with an inspection opening in its bottom. The inspection opening is held closed and sealed by the weight of sewage in the tank. Included in the systems are a baffled inlet in one side of the dome and a tubular outlet partly within the dome and partly within the septic tank for the discharge of treated sewage into an outlet pool between the tank and the pool wall. EVALUATION OF HEALTH HAZARDS ASSOCIATED WITH SOLID WASTE/SEWAGE SLUDGE MIXTURES,
East Tennessee State Univ. Johnson City, Tenn. Dept. of Health Sciences.
W. L. Gaby.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402. Environmental Protection Agency, Report EPA-670/2-75-023, April 1975. 47 p, 15 fig, 7 tab, 26 ref. 1DB064;ROAP 24ALU;Task 03. 68-03-0128.

Descriptors: Solid wastes, *Bacteria, Bioindicator, *Parasites, *Public health, *Sewage sludge, Recycling, Sludge, *Pathogenic bacteria.
Identifiers: Pathogens, *Composting, *Windrow composting process.

The health hazards associated with municipal solid waste/sewage sludge composting by the windrow composting process are described. The occurrence and survival of pathogens, parasites, and indicator bacteria at various stages during the composting process are described. The study shows that windrow temperatures of 120F to 167F (49C-74C) maintained for at least 7 days destroy pathogens and human parasites. Dog parasitic ova, however, remain intact 35 days after exposure. Considerable variation in the temperature is found at the top and bottom 2 inches of the windrow indicating that proper turning of the compost is essential to ensure destruction of pathogens and parasites. It is concluded that a properly composted solid waste or solid waste/sewage sludge mixtures is microbiologically acceptable as a soil conditioner for gardens, farms, and lawns, or for filling areas of erosion without creating health hazards. Identifiers: Land disposal.

About two-thirds of Florida is relatively flat land, generally with poor to very poor natural drainage. Consequently, sanitary landfills for many cities and counties are located in high water table areas. Before land disposal of effluent from a sanitary landfill may be used effectively, the impact on plants, soils, and groundwater should be evaluated. An excellent opportunity exists in Florida to improve unproductive land for other uses by sanitary landfilling. An unproductive low-lying area was reclaimed for pastureland by sanitary landfill on a sandy soil in a high water table area. Effluent from the trench method landfilling operation consisted of groundwater and leachate from previously filled trenches. The effluent was dispersed on nearby established pasture with a sprinkler irrigation system. No adverse effects on the soil or shallow groundwater were measured. Visual evaluation of the pasture grasses indicated an improvement in growth rate and appearance. (Sims-ISWS)

HEALTH ASPECTS OF POULTRY WASTE DISPOSAL,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio.
C. W. Chambers, and N. A. Clarke.
In: Second National Symposium on Poultry Industry Waste Management, University of Nebraska, Lincoln, May 19-20, 1964, p. 193-212. 18 ref.

Descriptors: *Poultry, *Farm wastes, *Waste disposal, *Public health, Bacteria, Fungi, Viruses, Diseases, Human diseases, Water pollution sources.

Interest in the disposal of poultry waste has stirred interest in the health aspects of poultry waste disposal. Many diseases are possibly communicable to man from poultry wastes. These diseases are caused usually by bacteria, fungi, or viruses. There are many avenues of transmission of the disease, such as direct contact with waste; ingestion of waste; inhalation of waste; and direct or indirect contact with vectors such as insects. Many diseases, such as those caused by the Salmonella species, can be transferred to man. To prevent the spread of disease, the poultry farmer should attempt to control conditions which result in multiplication of disease-producing organisms. The source of the disease-production should be eliminated if possible. The waste should be processed in a way which would breakdown the chain of infection. Above all, the poultry farmer should practice good management and remain rational about the subject of disease and disease potential. (Russell-East Central)

O AND M GUIDE FOR THE SUPPORT OF RURAL WATER-WASTEWATER SYSTEMS.
Conset, Inc., Washington, D.C. National Demonstration Water Project.
Commission on Rural Water, Chicago, Illinois, 1974, 283 p, 21 fig, 45 tab, 34 ref.

Descriptors: *Waste water treatment, *Sanitary Engineering, *Water treatment, *Management, *Marketing, Aeration, Flocculation, Oxidation, Coagulation, Filtration, Water supply, Treatment plants, Maintenance, Personnel management, Rural areas.
Identifiers: Handbooks.

Management of the support company is discussed from the start-up phase and organizational tasks, through the steady-state phase. Problems such as consumer complaints, and inspections are discussed. The water purification and distribution system operations are explained; technical terms are defined. The processes involved are delineated. Operation of a wastewater system is described. Waste disposal methods, and standards for purification are reviewed. Methods of monitoring the system are given. Skilled plant operators and their training are important. The job requirements and work loads for operators are discussed. Cost estimations of various parts of the system from equipment to power are presented. (Bradbeer-NWWA)

DESIGNING WATER TREATMENT PLANTS AT THE CIVIL ENGINEERING CONSULTING FIRM MELYEPTERV (VIZTISZTITAS TERVEZES A MELYEPTIESI TERVEZO VALLALATNAE),
Melyepterv, Budapest (Hungary).
G. Peter.
Hidrologiai Kozlony, Vol 55, No 6, p 233-235, June, 1975.

Descriptors: *Water treatment, *Design criteria, *Treatment facilities, Potable water, Civil engineering, Engineering personnel, Reviews, Surface waters, *Foreign research, Waste water treatment, Europe.
Identifiers: *Hungary.

The accomplishments of the consulting engineering firm Melyepterv in Hungary as the first native firm to design water treatment plants are described. Until the 1950's all water treatment facilities in Hungary had been constructed by foreign corporations. With development in urbanization and industrialization, new problems of water management have occurred. Experiences with removal of suspended solids, and water softening and desalination for industrial plants, and design of facilities for potable water have been successful. Also, iron and manganese removal and the treatment of surface waters to a potable water quality have been achieved. Research and development has been carried out at Melyepterv in the operation of new facilities. Such technical knowledge has been applied to clarification, filtration, iron and manganese removal, and taste and odor control. A review is presented of the standardization and product development at this firm and the water treatment plants developed by Melyepterv over the past two decades for customers in Lebanon, Nigeria, Cuba, and Czechoslovakia. METHOD AND APPARATUS FOR MONITORING AND CONTROLLING HALOGEN LEVELS IN A WATER TREATMENT SYSTEM,
D. P. DeVale.
United States Patent 3,897,798. Issued August 5, 1975. Official Gazette of the United States Patent Office, Vol 937, No 1, p 86, August, 1975. 1 fig.

Descriptors: *Patents, *Water treatment, *Monitoring, *Halogens, Equipment, Electrodes, Pollutant identification.

A patented method and apparatus to monitor and control halogen levels in a water treatment system are detailed. Given that a particular halogen substance in liquid has a predetermined redox potential, a probe including a pair of capacitively coupled electrodes disposed in the liquid is used. The electrodes are periodically pulsed with a voltage pulse having a peak value slightly above the predetermined redox potential, to store a charge in the capacitance. The stored charge decays between pulses via the liquid between the electrodes at a rate determined by the content of the halogen. The charge is sensed across the electrodes by means that operate to generate a substance level indication signal. Additionally, display means respond to the substance level indication signal and provide a visual display of the substance content. (Kramer-FIRL)

CLOSED-LOOP OZONE GENERATING CONTACTING SYSTEM,
H. Lee, and H. M. Rosen.
Canadian Patent 973,285. Issued August 19, Patent Office Record, Vol 103, No 33, p 82, gust, 1975.

Descriptors: *Patents, *Ozone, *Oxy Nitrogen, Carbon dioxide, *Water treatm Recycling, Water purification
Identifiers: Pressure swing fractionator.

A system has been patented by which water c treated with ozone and/or oxygen in a closed cycle. This conserves the high oxygen content A pressure-swing fractionator has the dual f tions of producing the necessary oxygen enri gas for subsequent use and maintaining a nitrogen level throughout the closed loop. fractionator removes nitrogen, carbon dio and water vapor from a feed gas to produce a ygen enriched gas, which then flows to a con tor or an ozonator. The oxygen enriched gas the ozonator contains from about one to s percent ozone. This gas mixture is then conta with water to be treated. Purified wate recovered, and excess oxygen rich gas (no least partially depleted in ozone and/or oxygen enriched in nitrogen) forms a recycle gas whi combined with a charge or air and flowed to pressure-swing fractionator to begin anc cycle. Descriptors: *Water treatment, *Floccula *Measurement, Equipment, Turbidity, Analy techniques.
Identifiers: *Speed regulation, *Velocity gradi

In the treatment of water, flocculation is c monly utilized for removal of turbidity. W mechanical mixing is used to achieve floccula a proper coagulant dose is necessary. Velo gradient (change in velocity per unit distance mal to the direction of velocity) has been acce as a rational parameter. It is assumed that the formance of a field flocculator is the same as in an (empirical) jar test of the velocity gradien method used in India is presented for measu mean temporal velocity gradient by the po input technique. The Ward-Leonard metho speed control was used to regulate the speed 220 V dc and 0.75 amp universal motor, to wh the flocculator shaft was attached. (Kramer-FI W76-00608

LARGE RURAL AREA ORGANIZES F POTABLE WATER,
Public Works, Vol 106, No 7, p 48-49, July, 197 fig, 1 tab.

riptors: *Administration, *Water distribu-Applied), *Water supply, *Rural areas, o, Construction, Cost comparisons, ines, Pumping stations, Water costs, *Potable r, *Water districts.
ifiers: Lorain County(Ohio).

w rurlal water district, organized in Lorain ty, Ohio, is one of the largest in the United s to be funded by the Farmers Home Ad-tration (FHA). Formerly, costs of filling a te residential cistern were as high as $65 per h. In August 1973, the Rural Lorain County r Authority was begun in order to integrate rea's water needs with the required financial echnical feasibility data. Public approval was d by the distribution of a question-and-er sheet concerning such matters as adminis-n, project financing, size of mains, amount ater pressure to be provided, and amount of mers' water bills. Following this, hearings eeded smoothly in the 16 political subdivi-. A program of construction was adopted to in August, 1975. Over 350 miles of pipe will id (over 360 sq m) for a distribution system, ding storage and pumping stations to bring ed water from ten miles away at the town of Lake. Estimated costs of constructing the g, service connections, valves, tanks, pump ns and other facilities are detailed; the total e about $11.5 million. A projection of costs to verage Lorain county subscriber indicate that will pay an initial rate of $9.00 per month of gallons of water; the next 2000 gallons will $3.50 per thousand gallons, with $3.00 per sand gallons charged after that. ifiers: *Hypalon floating cover.

water distribution system, the finished-water rvoir should be covered to prevent water ty deterioration due to animal or bird pings, dust and air- borne contaminants, ocarbon exhausts, algal growth, and vandal-About 10% of finished-water reservoirs are covered, but use post chlorination or surveil-as a measure of amelioration. In cities where s decided to cover their reservoirs, the choice between a rigid (Wood, concrete, or alu-m) or floating (Hypalon) cover. The floating r has been chosen in Charleston, South lina; Philadelphia, Pennsylvania; and Chil-ne, Ohio; these systems are detailed. Ad-ages of the floating cover are: low initial ; little maintenance; 100% resistance to ic disturbances; rapid installation; elimina-of evaporation of water or chlorine; elimina-of algae growth as well as taste and odor lems; and, flexibility in that any size or shape rvoir can be covered with a floating cover. e a rigid cover has a longer expected lifetime, its installation and maintenance costs are higher. In a rigid cover system, there is an air space between the water surface and the cover which must be kept well ventilated; in the floating system, the cover moves with the water level, keeping the reservoir water clean, and preventing chlorine and water treatment chemicals from evaporating. Federal pressure and state financial support have been given to cities wishing to cover their finished- water reservoirs, and the floating cover method presents a viable alternative. (Kramer-FIRL)

HOW BAD IS OUR TAP WATER.
Water and Sewage Works, Reference Number, p R114, R119-R120, April 30, 1975.

Descriptors: *Water treatment, *Potable water, *Water quality control, *Treatment facilities, Personnel, Research and development, Surveys, *Public health, Tastes, Odors, *Vermont.
Identifiers: *Community Water Supply Study(PHS).

The Bureau of Water Hygiene, Environmental Health Service of the U. S. Public Health Service conducted a national Community Water Supply Study (CWSS) during 1969 in eight geographically distributed Standard Metropolitan Statistical Areas and the State of Vermont. The study included 969 water supply systems serving about 18.2 million people. It was designed to assess the status of potable water quality, water supply system facilities, and bacteriological surveillance programs. The principal findings of the study are presented. The results of the study led to eleven specific recommendations; these are also presented. Some of the recommendations include: research to determine the influence of residual organics on the development of tastes and organism regrowth in distribution systems; research to understand what causes problems of appearance or taste in an otherwise safe drinking water; development of a more practical technique for bacteriological surveillance; development of new analytical procedures to tailor treaement to solve a specific taste or odor problem; engineering research to simpligy and lower the cost of reducing the concentration of fluorides and nitrates and other inorganics; development of a continuous monitor for trace metals and corrosion products; monitoring of pressure in strategic locations in water systems; improvement of water systems by installation of adequate pumps, reservoirs and backflow prevention devices; and, enlargement of existing water treatment plant personnel training program. CONTROL OF WATER QUALITY IN TRANSMISSION AND DISTRIBUTION SYSTEMS,
Roanoke County Public Service Authority, Salem, Va.
W. L. Rossie, Jr.
Journal of the American Water Works Association, Vol 67, No 8, p 425-427, August, 1975. 7 ref.

Descriptors: *Water distribution(Applied), *Distribution systems, Water conveyance, Water quality control, Baseline studies, Monitoring, Personnel, Operation and maintenance, Stress.

Water utility operators should be able to understand and anticipate stresses on a water distribution system. To control possible adverse effects from such stresses, the operator must prevent exposure, plan for emergency, discover stresses involved and modify conditions with this information, and, understand the interrelationship of variables and how to control them. The external environmental stresses that affect the internal environment of a distribution system include: insufficient treatment at point of procedure; open reservoirs; new construction; line breaks; cross connections; and, disaster operations. Each of these stresses is discussed. Monitoring of a water supply is very important. Tests for alkalinity, taste and odor, pH, turbidity, bacteria, chlorine residual, pressure readings, color, carbon dioxide, hardness, iron, and manganese should be performed to provide a routine check on the quality of water and background values. The use of baseline maps to plot background data quickly identifies abnormal readings that require more investigation. It is concluded that a distribution system is a living functional unit subject to stresses. Quality in design and construction and protective measures depend on quality materials and personnel. Adequate protective means are vital for stabilized operation and quality water in distribution systems. (Orr-FIRL)

EVALUATION OF STATE DRINKING-WATER-QUALITY SURVEILLANCE PROGRAMS,
Environmental Protection Agency, Atlanta, Ga. Region IV.
D. H. Taylor, and G. D. Hutchinson.
Journal of the American Water Works Association, Vol 67, No 8, p 428-431, August, 1975. 5 tab, 11 ref.

Descriptors: *Water supply, *Water quality, *Water quality control, Potable water, Water quality standards, Public health.
Identifiers: Water supply surveillance.

The important water supply conditions found in the States of Tennessee, Kentucky, Georgia, and Florida were summarized. The state water supply programs that provide for public health and engineering surveillance were also characterized. Three general classes of water supply systems were identified: community water systems; small community water systems; and, private, individual systems. A cross-section of the water supply field in each state was selected for study. The effectiveness of each state's water supply program was determined to a large extent on the bases of potable water quality, adequacy and condition of water system facilities, and water supply surveillance. The data showed great similarity between the status of the water supply field in the four states. Public health surveillance in the four states was not adequate to ensure continuous, safe drinking water. Lack of engineering inspection of system facilities was another common failure. Water system operation was found to be deficient in all states evaluated. Those facilities staffed with trained and certified operators were better water systems. Failure to maintain a chlorine residual throughout the distribution system was a common problem. It is concluded that the state legislatures, the administrative levels of state government, and the water supply field need to make strong commitments to restore and widen the margins of safety that water supplies provide in the southeast U. S. Safe and adequate water supplies will depend on the use of higher water utility service standards and regulation, surveillance, and enforcement by public environmental protection control agencies.(Orr-FIRL)

ION EXCHANGE WATER TREATMENT,
French Patent 2187-703. Issued February 22, 1974. French Patents Abstracts, Vol. 5, No. 11, February, 1974.

Descriptors: *Patents, *Ion exchange, *Demineralization, Automation, Beds, *Water treatment, Streams, *Water softening, Desalination.
Identifiers: Resins beds, Ion exchange plants.

An ion exchange plant for softening and demineralizing water is described. Part of the resin bed is periodically set aside for regeneration and then returned to the bed. Water for treatment is directed down through a first section of the resins bed, then turned and redirected up through a second section, at the top of which resin can be separated off for regeneration. Subsequently it is reintroduced at the top, upstream end of the first section. Even when fully automated, this plant does not require complex controls. (Prague-FIRL)

Descriptors: *Water law, Water quality standards, Water pollution, Common law, *Federal Water Pollution Control Act, *Georgia, *Social participation, Decision making, *Public rights, Administrative decisions, Land use, Planning.
Identifiers: Federal water law, Georgia water law, Effluent standards, Administrative law, Legal standing, Citizen suits, Rulemaking, Private attorney general, *Public participation, Public interest.

The public citizen is portrayed in the context of his or her function as a private attorney general or enforcer of water resources protection statutes. Opportunities for this kind of involvement, derived primarily from the Federal Water Pollution Control Act Amendments of 1972, are listed and explained. Common law actions which are avialable to protect Georgia's Water resources are summarized both to demonstrate the vaibility of this source of water quality protection and to reveal its inadequacies and weaknesses, which modern statutes are designed to cure. Technical language, that is, legal jargon, has been eliminated through paraphrasing wherever possible to ennance the value of the report to lay audience to whom it is primarily directed. Federal and state administrative procedure statutes are explained, with emphasis on provisions of most significance to citizens. A summary and explanation of the most important provisions of the Federal Water Pollution Control Act Amendments of 1972 and regulations adopted under it form the major part of the report. A practical view of state administrative procedure is presented in the context of a discussion of the Georgia Coastal Marshlands Protection Act of 1970.

Identifiers: Water pollution surveys, *Training manuals(Water pollution).

This training manual is designed for persons having responsibilities for planning and working in water pollution surveys. The chapter on sources of pollutants covers the pollutional characteristics of domestic waste waters, the sources and effects of industrial wastes, the influence of land runoff on water quality, irrigation return flow and agricultural runoff, and an overview on thermal pollution. Planning and conducting water quality surveys is explained in terms of organizing a stream survey, organizing a lake or impoundment survey, flow measurement, tracing natural water, sampling, sample handling, bacterial sampling, and the role of the bacteriologist in water quality surveys. The section on data handling and reporting includes: introduction to statistics; presentation of data; presentation and interpretation of bacteria data; preparation of survey reports; and the EPA Storet system. The aquatic environment, the identification of aquatic organisms, using benthic biota in water quality evaluation, biological field method, special applications and procedures for bioassay, and aquatic organisms of significance in pollution surveys are covered in the section on aquatic biology. The chemistry section explains the common water analysis tests. Bacteriological indicators of water pollution, analysis of coliform and fecal streptococcus groups, determination of bacterial pollution, and membrane filter techniques are discussed in the section on bacteriology. Dissolved oxygen and oxygen relationships are the topic of another section. Aerial reconnaissance in pollution surveillance and case preparation and courtroom procedure are also discussed. (Orr-FIRL)

SALINITY POLICY FOR COLORADO R BASIN,
Colorado State Univ., Fort Collins. De Agricultural Engineering
G. V. Skogerboe, and W. R. Walker
Journal of the Hydraulics Division, Proceed American Society of Civil Engineers, Vol 1 HY8, Paper 11510, p 1067-1075, August 197 13 ref, append.

Descriptors: *Salinity, *Water m ment(Applied), *Water policy, *Water control, *Colorado River basin, *Return Strip mines, Irrigation, Saltation, Colorado compact, Mexican water treaty, State g ments

Salt concentration and pickup by water, flow the Colorado River basin, creates problem areas in the lower basin. The water quality g the Colorado River of maintaining salinity co trations in the lower stem at or below p levels (nondegradation salinity policy) ha siderable merit, because specific contract treaties guarantee water quantities to states basin and to Mexico. The nondegradation s policy should be applied to each state, n setting numerical standards, but by offs salinity detriments resulting from each development with salinity control measure will maintain a net salt leaving state bound Salinity detriments from one water-use (e.g., coal strip mining or oil shale develop could be mitigated by investing in salinity c measures in another water-use sector (e.g provements in existing irrigation systems). A ble state policy will result in improved management that will facilitate water de ment. (Lardner-ISWS)

US-COMPREHENSIVE WATER
OURCES MANAGEMENT,
Corp., New York.
Kohlhaas.
r and Sewage Works, Vol 122, No 6, p 70-75,
1975. 1 fig, 7 ref.

riptors: Water resources, *Water resources
lopment, *Administration, *Comprehensive
ing, Water supply, Alternate planning, Alter-
e water use, *Hydrologic cycle, Water
ly, Water treatment, Waste water treatment,
ct planning.
ifiers: Generalized water balance diagram.

increasing demand for water supply and con-
for pollution-free receiving waters require a
rehensive approach to the planning of water
rces. A generalized water balance diagram is
key to comprehensive planning. Concepts
asized include non-point source pollution
ems. The diagram is based on the natural
ological cycle that begins with precipitation,
ff, and evaporation to the atmosphere, lead-
precipitation and a repeat of the cycle, and
e cycle of the use of water resources by man,
degradation through use, and their reclama-
and ultimate reuse. The purposes of the dia-
are: to provide general guidelines for water
rces and environmental planning; to identify
fic optionf for meeting water supply, waste
sal, and waste water reclamation goals; and,
ovide for the evaluation of specific water
rces alternatives. The generalized water
ce diagram consists of several systems and
stems: available supply system; surface
m system; evaporation; water supply and
disposal system; water use-reuse system;
dwater system; reservoir system:
stems of water supply sources; subsystem of
ge; water treatment subsystem; waste water
ment subsystem; flood retention sybsystem;
recreational impoundment subsystem; industrial use subsystem; and, miscellaneous use subsystem. The use of the diagram is illustrated by several examples. (Orr-FIRL)

TROUBLE IN PARADISE,
Clark Univ., Worcester, Mass. Dept. of Environmental Affairs.
H. E. Schwarz, and M. R. Eigerman.
Journal of the Hydraulics Division, Proceedings of ASCE, Vol 101, No HY5, p 603-612, May, 1975. 3 tab.

Descriptors: *Water quality control, *Water management(Applied), Administration, Water pollution control, *Massachusetts, Public benefits, Engineering, Environmental effects, *Planning, Social impact.
Identifiers: Merrimack Valley(Mass).

Overall planning problems for water quality control and waste water management are discussed. Social impacts are difficult to evaluate, and rather than a behind the desk data-gathering process, the Merrimack Wastewater Management Study was undertaken by interviewing local people in 15 surrounding towns and cities in this rural Massachusetts area. A matrix chart was used to record local issues and concerns, which was divided into vertical columns of 'plan actions' and horizontal rows of 'impact categories.' The plan actions were: water quality; water quantity; water supply; collection systems; treatment residuals; planning and design; construction; land modification; capital cost funding; private abatement actions; and operations. The 18 impact categories included: population; commercial fisheries; employment; housing; recreation; land use; municipal services; municipal finances; political process; and public health. The study of the Merrimack Valley area was designed to inventory the local people for their problems and needs; to translate the messages received from the matrix into engineering terms so as to get feedback from the citizens as to the most important issues; to compare the matrices for all 15 surrounding communities; and to make and implement real engineering and management alternatives. THE FEDERAL CONSTRUCTION GRANT PROCESS FROM A (BILENE) TO Z (ANESVILLE),
Environmental Protection Agency, Washington, D.C. Office of Water Program Operations.
J. T. Rhett.
Water and Sewage Works, Reference Number, p R20, R22-R24, R27-R28, April 30, 1975. 5 fig.

Descriptors: *Waste water treatment, *Financing, *Government finance, *Grants, Local governments, State governments, Legislation, Costs, Planning, Federal Water Pollution Control Act, *Treatment facilities.
Identifiers: PL 92-500, Federal Water Pollution Control Ace Amendments.

The ground rules for the investment of public funds for sewers and treatment facilities are primarily set forth in the regulations published in the Federal Register in February of 1974. However, the procedural requirements are only broadly sketched. The step by step activities of applying for federal funds are explained in this article. A rough outline of each step is presented in flow chart form. The steps include: preapplication activity; step one or facility planning which takes from 6 to 12 months; step two or facility design which takes from 6 to 12 months; step 3 or construction which takes from 2 to 4 years; and operation and maintenance which continues for the plant life or 25 to 30 years. The following types of Federal aid are available: grants for various planning activities; technical assistance, especially for facility design and construction and for enforcement; technical information from Federal research, demonstration and monitoring; training for State and local personnel; and environmental Financing Authority to help local governments raise their share of the costs of treatment facilities; and, a larger Federal share of costs to a uniform 75 percent. FINLAND'S CLEANUP CAMPAIGN,
J. Josephson.
Environmental Science and Technology, Vol9, No 8, p 710-711, August, 1975.

Descriptors: *Water pollution control, *Pollution abatement, *Legislation, *Financing, Pulp and paper industry, Biochemical oxygen demand, Phosphorus, Nitrogen, Industrial wastes, Municipal wastes, Energy, Monitoring, Water quality control, Standards.
Identifiers: *Finland.

The International Bank for Reconstruction and Development has granted a 15 yr loan of $20 million to finance a water pollution control program in Finland. This is the first pollution control loan ever granted by the World Bank. The water consumption and waste water production per capita in Finland are among the highest in the world, due to the large forest products and pulp and paper industries. Water protection is generally regarded as having the highest priority in the field of environmental pollution control in Finland. Finnish authorities spend about $56 million/yr on municipal waste water treatment. Within the next five years, 90% of the municipal waste water should be effectively cleaned. Water use and cleanup in Finland are regulated by its Water Act of 1961, which prohibits blocking, changing, or spoiling water courses without a permit. The National Board of Waters is administering a cleanup program that stresses BOD7, phosphorus, and nitrogen. The NBW conducts a monitoring program for discharges and ambient water quality. About 15 consulting firms are approved by the NBW to perform monitoring work for individual industries. The only environmental standards in Finland are those for water. An Air Protection Act and a Noise Abatement Act are being drafted by the Ministry of the Interior's Division for Environmental Protection. A Waste Management Act is also beind drafted. Laws concerning oil damages, environmental poisons, and biocides are already in force. Projects to recover and use waste heat from industry to provide space heating for buildings are examples of Finland's philosophy that the more completely fuel, materials, and heat are used, the less waste matter and energy are left to pollute. THE REVOLUTION IN WATER MANAGEMENT,
R. C. Rittenhouse.
Power Engineering, Vol 79, No 8, p 28-35, August, 1975. 2 fig, 2 tab.

Descriptors: *Water management(Applied), *Power system operation, *Water reuse, Legislation, Federal Water Pollution Control Act, Environmental effects, *Cooling towers, Thermal power, Thermal pollution, Water pollution control.
Identifiers: *Closed-cycle colling system.

Water management and its influence on all aspects of power generation is discussed. Because of the Federal Water Pollution Control Act Amendments of 1972, all new plants must conform to EPA guidelines or must convert to a closed-cycle cooling system. The field of environmental management is rapidly growing, and a multidisciplinary staff includes: chemists, biologists, meteorologists, physicists, mathematicians, and socioeconomists, as well as civil, mechanical, and chemical engineers. With this approach, the functions of cost-benefit analyses and the solving of specific technical problems may best be implemented. Industry objections to the new EPA guidelines have been that stringent legislation fails to recognize differences in the location, design and requirements for the operation of individual power plants. The largest protesting group was the Utility Water Act Group (UWAG), which opposed most strongly the guidelines for thermal effluents. Costs versus benefits of control measures are discussed, and a possible change in water pollution control policies which might take place between the 1977 and 1983 compliance deadlines is recommended. Specific problems of various facilities, including dry and hybrid cooling towers, cooling ponds and lakes, and spray ponds and canals are detailed. Also considered are new business opportunities in water and waste management, as a result of new applications of reuse. (Kramer-FIRL)

STORM WATER MANAGEMENT MODEL: DISSEMINATION AND USER ASSISTANCE,
University City Science Center, Philadelphia, Pa.
J. A. Hagarman, and F. R. S. Dressler.
Environmental Protection Agency, Report EPA-670/2-75-041, May 1975. 46 p, 23 fig, 13 tab, 10 ref, append. 1BB034 ROAP: ATA Task 020. R-802716.

Descriptors: Water quality control, Mathematical Models, Rainfall, Surface runoff, Waste water treatment, Erosion control, Water pollution, Control, Storm water, Model studies, *Information exchange, Computer programs, Data storage and retrieval, Computer models.
Identifiers: Stormwater management, Urban stormwater, *Storm water management model.

A program of dissemination and user-assistance for the EPA Storm Water Management Model (SWMM) has been developed and implemented. Services available to SWMM users include distribution of the SWMM program itself and technical assistance in problem delineation, data preparation, execution debug, and output interpretation. Costs of this service extend only to actual computing costs. Several case studies of SWMM applications completed with UCSC assistance in the past year included in this report. These studies include a combined sewer overflow problem in Binghamton, New York; a land use plan in the Stony Brook basin in Princeton, New Jersey, and RUNOFF/TRANSPORT calculations on the Wingohocking basin in Philadelphia, Pennsylvania. The UCSC SWMM dissemination program is now self sustaining and continues to assist the user community. (EPA)

Bureau of Sport Fisheries and Wildlife, Columbia, Mo. Fish-Pesticide Research Lab.
J. L. Brauhn, and R. A. Schoettger.
Available from the National Technical Information Service Springfield, Va 22161. Environmental Protection Agency Report EPA-660/3-75-011, May 1975. 45 p, 4 tab, 83 ref. 1BA021. EPA-LAG-0153(D).

Descriptors: *Freshwater fish, *Quality control, Feeding rates, Water quality, *Rainbow trout, *Channel catfish, Fish diseases, Pesticide residues, Water quality control, Water pollution control.
Identifiers: *Fathead minnows, Bluegill sunfish, Genetic stocks.

Rainbow trout (Salmo gairdneri), channel catfish (Ictalurus punctatus), fathead minnows (Pimephales promelas), and bluegills (Lepomis macrochirus) are cultured widely for toxicological research. However, vacillant or extreme cultural conditions are sometimes suspected of comprising the test animals and, thus, results of comparative or confirmatory research. Because exact optimum conditions for indoor maintenance and culture of the four species are not well defined, standardized practices were adopted that are intended to reduce cultural conditions to a common variable status. Water quality, nutrition, genetic variation, diseases, fish handling, gross behavior, and required facilities are discussed. Well known propagation techniques provide the basis for the intensive care methods used. Special emphasis is given to diets, diet preparation, and residues of pesticides or other contaminants in diets and fish. (EPA)

ANIMAL WASTE MANAGEMENT WITH PO LUTION CONTROL.
Ohio Agricultural Research and Developm Center, Annual Report, NC-93 October 1974, 2 9 fig, 12 tab, 6 ref.

Descriptors: *Lagoons, Economics, *Od *Ohio, Soils, Agricultural runoff, *Farm wast Hogs, Rates of application, Groundwater, Wa quality, Water pollution control, Waste disposal
Identifiers: Waste management, *Composti *Land disposal.

The Agricultural Engineering Department c tinued to evaluate handling swine waste w flushing and a two stage lagoon system. Expe mental objectives were: to determine the tre ment efficiency of the system, measure nitrogen losses in each unit, determine whet ground water pollution occurs from the lagoo and to evaluate the system with respect to equ ment system effectiveness, and economics. another experiment, a built-up bed, aerobic co poster was designed to provide both treatment a storage capability. Evaluations of rate of applic tion, type and condition of manure, temperatur achieved within the composting mass and resulta compost quality and condition are in progre Other projects underway include livestock was systems and studies of malodorous substances a their abatement. The Agronomy Department h installed field lysimeters to determine the ma imum rate of cattle manure that can be applied various Ohio soil types without adversely affec ing groundwater quality. Cooperative research h been initiated through a Memorandum of U derstanding between the Ohio Agricultur Research and Development Center and USDA ARS-North Appalachian Experiment Watershed, Coshocton, Ohio. Numero watersheds are available to study runoff fro pastures and feedlots. Cow herds will be manage under 3 systems: (1) limited stocking rate and fe tilizer application with grazing during the growi season only; (2) high stocking rate and fertiliz application with year-long grazing and; moderate fertility and stocking rate with hay fe on pasture during winter. Cattle will be fed drylot with varying proportions of concentrate and roughages. Runoff, ground water and so sediments will be analyzed for N, P, K, BOD, et where applicable. ptors: *Return flow, *Waste
Pollution), Wastes, Agriculture, Irrigation,
ion practices, Irrigation effects.

the practice of irrigation has detrimental ef-
n water quality, irrigation return flows must
nsidered an agricultural waste. The major
quality problem is increased salt concentra-
the return flows as a result of the pickup of
ls from the soils and the loss of water
h evapotranspiration. Irrigated agriculture is
rgest consumer of water resources, and
flows constitute a large portion of the flow
ny western streams. Salt concentrated by
ranspiration must be leached from the root
o continue crop production. This necessity
hing to maintain a salt balance concentrates
n the return flows and causes damage
tream. (Skogerboe-Colorado State)

Descriptors: *Distribution systems, *Simulation analysis, Operations, Planning, *Control, *Optimization, Pumping, Networks, *Water allocation(Policy), *Model studies.
Identifiers: *Operations planning, Network analyses.

The studies were conducted in three parts. In the first part, a field experiment was performed to validate a model for extended period simulation of water distribution systems. The experiment and its results are discussed. In the second part, a three level hierarchical model was developed for operations planning and control of water distribution systems. The three levels, namely the monthly, daily and the hourly level, address source or pump scheduling with a shorter time horizon, but on a more detailed and refinde system model. The monthly and daily models provide support to the hourly model in determining set points for pump source scheduling. Each model is of direct use in its own right for operations planning. Preliminary numerical results are presented for optimizing pumping operation in the system using an experimental code. The thrid and final part presents preliminary results on reduced order representations of distribution networks. (See also W74-05533)

Identifiers: *International agreements, *Seabeds.

The work of the First Main Committee of the Third United Nations Conference on the Law of the Sea is examined, with particular emphasis on the proper system of exploitation and exploration of the seabed beyond the limits of national jurisdiction. The center of attention is draft Article Nine, entitled 'Who May Exploit the Area', several formulations of which had been drafted in preparation for the Conference. The delegates' negotiations on Article Nine, they exemplify the divergent positions of developed and developing nations on issues concerning exploitation of the deep seabed and subsoil. Major issues at the Conference included: (1) whether there should be a single or multiple system of exploitation and exploration of seabed; (2) the proper role to be played by the proposed International Sea-bed Authority, and the degree of control which the Authority should be permitted to exercise over such activities; and (3) whether detailed rules and regulations concerning seabed activities should be written into the proposed Convention itself, as opposed to incorporating only a framework of general norms to guide the Authority. Recommendations are presented for future discussions, and an alternative text is proposed. (Schilling-Florida)

Identifiers: *National Environmental Policy Act, *Florida Air and Water Pollution Control Act.

Certiorari was sought in the First District Court of Appeal to review an order of taking entered in an eminent domain proceeding by the lower court. The petitioners alleged that the Department of Transportation failed to properly consider the costs, environmental factors, area planning, and alternate routes to the right of way granted and that the respondent has failed to comply with the National Environmental Policy Act (NEPA) of 1969 and with the Florida Air and Water Pollution Control Act (FAWPCA). The court held that the actions by the Department of Transportation did not constitute an oppressive exercise of its authority and that the evidence failed to establish any violation of the NEPA, the FAWPCA or the Federal Aid Highways Act. Descriptors: *Land use, Environment, Eco Legislation, Water Resources, Planning, An cal techniques, Zoning, Ecosystems, Dec making, Environmental control, Planning, S aspects.
Identifiers: Land Use Controls, Model Land Legislation.

An ecologically responsible land use deci making system is proposed for local, regional to an extent, state governments. Referred t LUDMS, it is based on conclusions that governments have not dealt effectively with use problems because traditional planning land use control devices are unecological, responsive and unsystematic. The fundame premise of LUDMS is that environmen responsible land use planning and control mus

d on valid ecological information combined
enlightened and informed public opinion.
)MS makes use of several basic concepts, in-
ng policy planning (a process for combining
ic opinion with scientific and technical infor-
on to create community policies); use of an in-
sciplinary team; public participation; an en-
mental resources inventory and analysis; a
which understands and can communicate
t ecology; legal devices for land use control;
positive community programs. 'Model' state
ocal codes for implementing LUDMS are pro-
l. (EPA)

ifiers: *Water problems, Arizona State Water

Arizona Water Commission is developing a
Water Plan in the following three phases: (1)
ventory of the resource, current uses and as-
ted problems; (2) an identification and
iption of alternative futures available to the
; and (3) an evaluation of potential water
rce management plans. The series of studies
provide the physical and economic informa-
equired for the people of the state, local plan-
and legislators to make rational decisions
erning management of Arizona's water. This
tion is the first phase of the plan which
nts a status report on the state's water
rces, a look at the present situation, and an
ation of today's water problems. Information
en on existing water uses and supplies, popu-
, economy, water law, and major water
ems and needs. Also included in the study are
natic diagrams of rivers and streams in
na, crop distributions, theoretical depletions,
ecords of U.S. Geological Survey stream gag-
ations in Arizona. The report provides a sin-
ource of available information for the non-
ical user, a display of regionalizations and
arizations for the broad scope planner, and a
graphy of data available for detailed in-
gation. (Robinett-Arizona)

**CUTIVE SUMMARY OF CRITICAL
ER PROBLEMS FACING THE ELEVEN
TERN STATES.**
u of Reclamation, Washington, D.C.
1975. 85 p, 36 fig, 2 tab.

riptors: *Comprehensive planning,
ning, *Forecasting, *Coordination, *Water
nd, *Water utilization, Southwest U. S.,
c Northwest U. S., *Water policy, *Water al-
on(Policy), Management, Long-term
ing, Future planning(Projected).
fiers: *Western U. S.

Executive Summary is supported by a com-
nsive report which presents in detail the
s of the Westwide Study. Generally the sum-
follows the outline and content of the report
resents in concise terms the highlights and
icant conclusions and recommendations of
port. The major contribution that these two
s can make is to define and influence the
and character of future Federal and State water resources investigations of the West through the year 1985. The present and near future critical water resources problems and issues of the West are clearly outlined. (See also W76-00717) (OWRT)

WESTWIDE STUDY REPORT ON CRITICAL WATER PROBLEMS FACING THE ELEVEN WESTERN STATES.
Bureau of Reclamation, Washington, D.C.
April 1975. 457 p, 67 fig, 153 tab.

Descriptors: *Comprehensive planning, *Planning, *Forecasting, *Coordination, *Water demand, *Water utilization, Southwest U. S., Pacific Northwest U. S., *Water policy, *Water allocation(Policy), Management, Long-term planning, Future planning(Projected).
Identifiers: *Western U. S.

The goal of this study effort, as outlined in Chapter I, Study Purpose, History and Approach, has been the development of adequate information upon which to base future significant decisions relative to the water and related resources of the 11 Western States. Chapter II, The Westwide Situation, provides an assessment of the present setting on water and land resources, population, economy, environment, minerals and energy. Chapter III, Aspects of the Future, examines various important factors which will influence water planning in the Westwide area with emphasis on year 2000. Chapter IV, Westwide Problems, discusses critical problems that are common to most of the 11 Western States. Chapter V, Regional Problems, presents critical problems that affect large geographic areas involving two or more States. Chapter VI, State Specific Problems, sets forth critical problems, more closely identified with individual State conditions. In the latter three chapters, various approaches to problem resolution are discussed, conclusions drawn, and recommendations made for supplemental or new studies were considered appropriate. Chapter VII, General Observations, synthesizes and consolidates the multitude of conclusions and recommendations. (See also W76-00716) (OWRT)

WATER RESOURCES OF WASHINGTON, A BIENNIAL REPORT TO THE LEGISLATURE, JANUARY 1975.
Washington State Dept. of Ecology, Olympia.
Biennial report, January 1975. 33 p, 5 fig, 3 tab.

Descriptors: *Water resources, *Washington, *Water supply, *Water rights, *Comprehensive planning, Planning, Management, State governments, Financing, Legislation, Lgal aspects, Water law, Water resources development, Surface waters, Groundwater, Irrigation, Industries, Hydroelectric power, Municipal water, Domestic water, Water utilization, Water shortage, River basins.

The Water Resources Act of 1971 directed Washington's Department of Ecology to develop a comprehensive state water resources program. For planning and management purposes, the state has been divded into 23 river basins plus the main stem of the Columbia River. Separate policy is being developed for each basin, and statewide policies are being created to deal with critical problems requiring consistent management. A water Resources Information System was established to serve as an archive of state water resources data. Surface water, groundwater, and saline water supply available in Washington was presented here, and existing use of water for domestic, municipal, and industrial supply was described. Irrigation accounts for 65% of total withdrawals from surface and groundwater sources, and current projections indicate irrigated acreage in the state will increase 50% by the year 2000. It was concluded that the existing water supply in Washington is inadequate or only marginally adequate to provide both instream needs and diversion requirements. The multitude of laws and treaties governing water rights in the state were explored, and several recommendations for changes in the state water code were made. Financial aspects of water resources development were discussed. A color map of federal and non-federal development projects was included. (Robinson - ISWS)

DISAPPROVAL OF THE DEFERRAL OF WATER POLLUTION CONSTRUCTION GRANT FUNDS.
Hearing--Subcommittee on Environmental Pollution, Committee on Public Works, U.S. Senate, 94th Congress, 1st Session, February 28, 1975. 101 p, 4 fig, 5 tab.

Descriptors: *Project planning, *Sewage treatment, *Treatment facilities, *Grants, Decision making, Administrative decisions, Employment, Construction, Planning, Legislation, Federal project policy, Federal government, United States, Water pollution, Public utilities, Judicial decisions, Federal Water Pollution Control Act.
Identifiers: *Funding(Federal), Environmental Protection Agency(EPA), *Federal Water Pollution Control Act Amendments.

In 1972 Congress authorized $18 billion for sewage treatment plants and related facilities. Half of this money, $9 billion, was Presidentially impounded before being ordered released by the Supreme Court. This Senate hearing was scheduled to consider a resolution disapproving the deferral of water pollution construction grant funds. Several water pollution and sewage treatment experts testified that not only could the amount released be put to quick and effective use, but much greater amounts as well. Delays in funding the sewage treatment construction were named as the reason for state lack of faith in the program, and for much inefficiency in state planning of sewage treatment projects. The experts said that immediate release of the money would have many beneficial effects, including the completion of a backlog of projects which have had to be postponed, and a 'ripple' effect on unemployment in states where the construction industry has been faltering. Since some states have fully committed their 1974 funds and a major portion of their 1975 funds, full allocation of the $9 billion will allow them to continue making progress toward achieving the goals of the 1972 Amendments. PROCEEDINGS, CONFERENCE ON WATER REQUIREMENTS FOR LOWER COLORADO RIVER BASIN ENERGY NEEDS.
Arizona State Fuel and Energy Office (Phoenix).
Available from Office of Arid Lands Studies, Univ. of Arizona, Tucson, Arizona 85719, for $10.00. Held at University of Arizona, Tucson, May 8-9, 1975, 344 p.

Descriptors: *Energy, *Water requirements, *Colorado River Basin, *Water demand, Water supply, Water utilization, Water management(Applied), Water quality, Geothermal studies, *Industrial production, *Competing uses, Oil shales, Arizona, *Southwest U.S., Planning, Environmental effects.
Identifiers: Coal gasification, Solor energy, Lower Colorado River Basin.

The conference was designed to provide the latest technical data on the management of water and energy needed to produce new energy sources in the Lower Colorado River Basin and relate this to the cost of maintaining the present environment. Of particular interest at the Conference was the realization that it takes energy, as well as water, to extract energy. Therefore, the papers delivered assessing new energy technology--oil shale, coal gasification, geothermal, and solar--accounted for both requirements. (See W76-00746 thru W76-00761)

WATER AND ENERGY REQUIRED TO OPERATE COAL GASIFICATION FACILITIES AND WASTE WATER TREATMENT REQUIREMENTS,
El Paso Natural Gas Co., Tex.
P. Milios.
In: Conference on Water Requirements for Lower Colorado River Basin Energy Needs, May 8-9, 1975, p 122-132. 1 fig.

Descriptors: *Water requirements, *Water supply, *Coal mines, *Waste water treatment, *Natural gas, Coal mine wastes, Water pollution, Water demand, Economics, Water allocation(Policy), Water utilization, Water resources, Arid lands, Water conservation, Water sources, Colorado River, Planning, Efficiencies, Water reuse, Recirculated water, *New Mexico, *Energy, Water consumption(Except consumptive use).
Identifiers: Lurgi coal gasification, El Paso Natural gas, *San Juan River(NMex), Energy requirements.

A coal gasification plant using Lurgi coal gasification technology that the El Paso Natural Gas corporation is planning to build in the Four Corners Area of New Mexico is discussed. The first plant will require 10,357 acre-feet per year of water from the San Juan River (a tributary of the Colorado) and will produce 275 billion Btu of synthetic pipeline gas. A water requirement of one gallon for each 27 thousand Btu includes provisions for mining coal, excluding electric power for the mine, for electric power and steam generation to run the plant, for a potable water system for the plant, and for supplying hydrogen for the gasification reactions. A detailed description of water reuse in the coal gasification process is given. Of the total water entering the process plant, including water contained in the coal as moisture, 67% evaporates, 24% is consumed via chemical reaction, 2.5% leaves the ammonia by-product, and the remaining 6.5% leaves the plant in flue gases, ash, and cooling tower drifts. (See also W76-00745) (Robinett-Arizona)
W76-00751

WATER AND ENERGY REQUIREMENTS TO MINE, PROCESS, AND REPROCESS NUCLEAR FUELS,
Arizona Univ., Tucson. Dept. of Nuclear Engineering.
R. L. Seale.
In: Conference on Water Requirements for Lower Colorado River Basin Energy Needs, May 8-9, 1975, p 133-150. 7 fig, 2 tab, 5 ref.

Descriptors: *Water requirements, *Water utilization, *Nuclear powerplants, *Electric power production, Water resources, *Water demand, Economics, Costs, Efficiencies, Nuclear reactors, Electric power, Water cooling, *Energy, Cooling water, Cooling towers, Heated water, Water consumption.
Identifiers: Energy requirements.

About 8% of the present electrical generating capacity in this country is in the form of nuclear generating plants. The largest water utilization outside the power plant is in the enrichment operation. This is the water associated with the generation of the electrical energy for enrichment which is counted twice if the reactor supplies the enrichment electrical energy. Water needs are a strong function of the cooling option that is used in the power plant. Evaporative cooling in wet cooling towers or the use of ponds or rivers for cooling use more water than the wet-dry radiator type of cooling but at the same time the cost varies drastically from location to location. Water required by a single 1,000 megawatt power plant in million gallons per year is 123 for mining, 65 for milling, 26.3 for Uranium production, 11,900 for isotopic enrichment, 5.2 for fuel fabrication, 65,000 to 554,000 for the nuclear power reactor, 10 for fuel processing and 0.26 for waste management. W76-00752

WATER AND ENERGY REQUIREMENTS IN THE MINING AND PROCESSING OF COAL, INCLUDING LAND RECLAMATION,
Peabody Coal Co., St. Louis, Mo.
E. D. Neihaus.
In: Conference on Water Requirements for Lower Colorado River Basin Energy Needs, May 8-9, 1975, p 151-164. 3 fig.

Descriptors: *Water requirements, *Water utilization, *Coal mines, *Water supply, *Arid lands, Strip mines, Coal mine wastes, Water demand, Economics, Costs, Water resources, Water sources, Planning, Efficiencies, Electric power production, *Arizona, Groundwater resources, Land reclamation, Revegetation, Aquifers, *Energy, Water consumption.
Identifiers: Energy requirements, Black Mesa(Ariz), Black Mesa mine, Peabody Coal Company.

The Peabody Coal Company's Black Mesa Mine on the Black Mesa in Northeastern Arizona is discussed. The mined land is graded and revegetated so that it is a good or better grazing land than it was before it was mined. Annual water consumption by the operation is 3,000 to 3,500 acre-feet and it is estimated that the Navajo sandstone, which furnished the water, contains an estimated 10 million acre-feet. In 1974, the mined used 75,000,000 gallons of water and the pipeline to the power plant in Nevada required 1,097,800,000 gallons (298 gallons/ton of coal). Estimations show that the operation will deliver about 100 Btu for every one consumed. (See also W76-00745) (Robinett-Arizona)

WATER AND RELATED LAND RESOURCES (AS AMENDED).
Minnesota Sess. Laws, Vol 4, Ch 558, S F No 734, p 1069-1073, approved--effective immediately (1974).

Descriptors: *Minnesota, *Legislation, *Water allocation(Policy), *Priorities, *Comprehensive planning, Future planning(Projected), Preferences(Water rights), Water management(Applied), Appropriation, Water utilization, Water law, Water rights, State governments, Legal aspects, Water conservation, Regulation, Administration, Water policy, Public rights, Water demand, Water resources development, Water resources, Water supply, Priorities, Prior appropriation.
Identifiers: Environmental policy, Administrative regulations, Public trust doctrine.

The Minnesota state commissioner of natural resources, in cooperation with other federal, state and local agencies, is directed to prepare a statewide water and related resources plan to be approved by the legislature. The Commissioner shall establish rules and regulations governing the granting of permits for appropriation and use of public waters, and for changing the course, current, or cross-section of public waters. These regulations shall be consistent with standards herein set forth and the following priorities for appropriation and use of water: domestic water supply; uses involving consumption of less than 10,000 gallons per day; power production, industrial and commercial uses; and other uses involving consumption in excess of 10,000 gallons per day. Appropriation or use of any waters of the state, surface or underground, without written permit of the commissioner is prohibited. This prohibition does not apply to domestic uses serving less than 25 persons. The Commissioner shall impose charges for the excavation of minerals from the beds of public waters. The Commissioner shall also assess the need for particular kinds of lake improvements and shall establish criteria for allocating state aid funds among proposed projects. (Deckert-Florida)

on sources, Water quality, Oil industy, Judi-
ecisions, Penalties(Legal), Federal jurisdic-

iers: Coastal waters, Hazardous sub-
s(Pollution).

ecent case, Union Oil Company v. Oppen,
inth Circuit applied California tort law to
commercial fishermen to recoup business losses caused by a negligent oil spill. This decision runs contrary to the generally accepted principle that no recovery is available for economic losses suffered as a result of a defendent's negligence. In arriving at its holding the Ninth Circuit made two essential determinations: (1) The oil company owed a duty to the commercial fishermen to conduct its drilling operations in a reasonable prudent manner to avoid the negligent diminution of the aquatic life; and (2) Any such diminution and damage to fishing could have been anticipated. The court cited the policy considerations against pollution, the need for deterring oil spills, and the economic theory of the optimum apportionment of losses to support its decision. Environmentalists will benefit from the decision because a more pervasive duty of care will be imposed on oil companies engaging in offshore drilling. (Nursey-Florida)

MINERAL DEVELOPMENT AND THE ENVIRONMENT: LEGAL REFORMS FOR THE SITING OF MAJOR FACILITIES,
R. P. Hansen.
Rocky Mountain Mineral Law Institute Annual, Vol 20, p 565-599, 1975. 70 ref, append.

Descriptors: *Federal government, *State governments, *Sites, *Industrial plants, *Legal aspects, Clean Air Act, Planning, Mining, Mining engineering, Colorado, Regional development, Regulation, Environmental control, Environmental engineering, Environmental effects.
Identifiers: Environmental monitoring, Legislation(Proposed), Private sector planning, Environmental impact statements, National Environmental Protection Act.

The conflicts between environmental values and economic developments usually focus on the siting of industrial facilities. Four arguments precede a discussion of governmental and private siting efforts. First, environmental impact statements have little impact upon actual decision-making. Second, the private sector is more likely to produce innovative planning techniques. Third, environmental analysis will become a regular part of mining operations. Finally, initial federal procedures on environmental planning will be augmented by procedures from the private sector and other levels of government. Existing federal legislation encourages environmental planning in addition to requiring disclosure of adverse environmental effects. The Clean Air Act authorizes the states to regulate air pollution from any major industrial facility, including mineral facilities. The main problem with current federal legislation is that each act is only a piecemeal solution of pollution problems. Recent federal legislation is aimed at providing comprehensive land use regulation which also permits states to devise their own methods of planning. Some state legislation regulates industrial-site planning. Progress is being made by several mining companies towards involving the public in planning new sites. Several new organizational tools are needed to integrate planning efforts, such as an environmental data bank and monitoring system. (Jenkins-Florida)

THE BOUNDARY WATERS TREATY OF 1909: DOES IT PROVIDE AN ENVIRONMENTAL CAUSE OF ACTION,
A. T. Carter.
South Dakota Law Review, Vol 20, No 1, p 147-180 (1975). 34 p, 174 ref.

Descriptors: *Treaties, *International law, *Canada, *United States, *Legal agents, Penalties(Legal), Constitutional law, Jurisdiction, Federal jurisdiction, Water law, Governmental interrelations, Internation waters, Foreign waters, Foreign countries, Water pollution, Water quality, Water pollution control, Water pollution sources, Path of pollutants, Water pollution effects.
Identifiers: *Garrison Division Project, *Boundary Waters Treaty of 1909, *Standing(Legal).

The Garrison Division Project is used as a frame of reference to examine, whether the Boundary Waters Treaty of 1909 provides a cause of action Which may be asserted by Canadian citizens in United States courts against the Federal Government for polluting waters crossing the boundary. Treaties are the supreme law of the land pursuant to Article VI of the Constitution and as such, are binding upon the States. Responsibility for giving effect to a treaty rests in part on the judiciary. Whether a particular treaty is entitled to judicial enforcement depends on whether a claim for relief arising under the treaty gives rise to a justiciable controversy. In the case of the Boundary Waters Treaty, justiciability depends on the following factors being shown: (1) the treaty is self-executing; (2) the legislation authorizing the Garrison Division Project does not abrogate the treaty; (3) the treaty grants private rights and remedies; (4) relief is not precluded by failure to exhaust provisions of the treaty; (5) consideration of the treaty is not barred by the political questions doctrine. All five factors are examined and it is concluded that the treaty does provide a cause of action for Canadian citizens in American courts. (Nursey-Florida)

LAKE STREAM CONTRVERSY: A FINAL DECISION,
N. J. Schexnayder.
Loyola Law Review, Vol 21, No 1, p 264-270, 1975. 56 ref.

Descriptors: *Louisana, *Accretion, *Boundaries(Property), Boundary disputes, High water mark, Low water mark, Legal aspects, Water law, Shores, Civil law, Judicial decisions, Legislation, Natural resources, Water rights, Bodies of water, Rivers, Lakes, Streams, Inland waterways.
Identifiers: *Articles 509 and 510 of the Louisiana Civil Code.

The Louisiana law concerning ownership of accretion is dicussed. In interpreting Articles 509 and 510 of the Louisiana Civil Code, the Supreme Court of Louisiana has held the only acknowledged right to the ownership of accretion is that of the accretion formed on rivers and running streams. The legal boundaries of lakes or ponds remain unchanged even though thin physical boundaries may change due to natural processes. The major controversy concerning ownership of land formed by accretion arises in determining whether a body of water is a river or running stream. In the past, the Louisiana courts have held that the ability of a body of water to form accretion is the primary factor to be considered in classifying it. A recent Louisiana Supreme Court case which employs a new test to determine the legal classification of a body of water is discussed. The court turned to a multiple factor test for the classification of a body of water, considering the size, depth, bank, channel and current of the particular body of water, especially as compared to that of streams that enter it. The court also gives heavy consideration to the historical designation of the body of water.(Nursey-Florida)

LIBRARY U. OF I. URBANA-CHAMPAIGN

vironmental control, Permits, Droughts, Legal aspects, Research and development, Agroclimatology, Climatology, Cloud physics, Flood control, Meteorology, Weather, Weather data, Control.
Identifiers: Licenses, National Environmental Policy Act, State policy, Administrative regulations.

The issue of state versus federal control of weather modification is discussed. An Oklahoma senator has proposed federal legislation to provide matching funds for the Oklahoma Weather Modification Act and similar state programs. Weather modification techniques have aroused opposition by environmentalists. The Oklahoma Act provides that persons engaging in weather modification activity without a license or permit shall be subject to a misdemeanor citation and a fine. Authority for local governments to raise revenue for weather control projects is included in the Act. The federal bill would authorize the Environmental Protection Agency (EPA) administrator to carry out an emergency drought assistance and prevention program where livestock or crops are threatened. Matching fund grants to encourage states to develop weather control programs would be available. A second bill would establish a National Weather Modification Commission under the EPA. Coordinated research and development combined with the environmental safeguards of National Environmental Policy Act indicate that federal assistance in state weather control projects is desirable. CUSTOMARY USE OF FLORIDA BEACHES,
P. Ireland.
University of Miami Law Review, Vol 29, No 1, p 149-153, 1974. 5 p, 27 ref.

Descriptors: *Florida, *Judicial decisions, *Public rights, *Prescriptive rights, *Local governments, Beaches, Legal aspects, Zoning, State governments, Recreation facilities, Public benefits, Public lands, Land tenure, Recreation.
Identifiers: Declaratory judgement, Custom(Doctrine), Injunctive relief, Property law.

Plaintiff, owner of an observation tower, sought a declaratory judgement against defendant, municipality and construction company, which had been issued a permit to build a tower. Ownership of the land underneath the proposed building was in controversy. Plaintiff claimed that the public had acquired a prescriptive right to use the land. Florida courts have required clear proof of adversity to establish a public right by prescription. A presumption that public use is permissive must be overcome to prove adverse use. In the instant case, the Supreme Court ruled that plaintiff had not established a public easement by prescription because defendant owned an adjacent pier and therefore sought the presence of the public. Summary judgement in favor of plaintiff was vacated and the case remanded to determine whether a public right was established by custom. Where public use of a private beach is reasonable and has continued for many years without dispute or interruption, a public right evolves from custom. A land owner may not then use the land in a manner inconsistent with the public right. The decision represented the first time that the Florida Supreme Court utilized the doctrine of custom to establish public rights in private property. (Jenkins-Florida)

THE THIRD UNITED NATIONS CONFERENCE OF THE LAW OF THE SEA: THE 1974 CARACAS SESSION,
J. R. Stevenson, and B. H. Oxman.
American Journal of International Law, Vol 69, No 1, p 1-30, 1975. 60 ref.

Descriptors: *United Nations, *Treaties, *Law of the sea, *International law, Negotiations, Legal aspects, Water rights, Governments, International waters, Water law, Governmental interrelations, Navigation, Fishing, Resources, Organizations, Foreign countries, Foreign waters, Oceans.
Identifiers: *The Third United Nations Conference on the Law of the Sea, Coastal waters, Contiguous zone.

The accomplishments and failures of the 1974 Session of the Third United Nations Conference on the Law of the Sea are described. The object of the Law of the Sea Conference is a comprehensive Law of the Sea Treaty. While this was not achieved, the 1974 Session accomplished a great deal and the foundation has been laid for a workable treaty. The most important accomplishments of the session are as follows: (1) an agreement was reached on the Rules of Procedure and the Conference adopted a 1975 work schedule deliberately devised to stimulate agreement; (2) the inclusion in the treaty of a 12-mile territorial sea and a 200-mile economic zone was all but formally agreed upon; (3) the first steps have been taken toward real negotiation of the basic questions of the system and conditions of exploitation of deep seabeds; (4) traditional regional and political alignments of states are being replaced by informed groups whose membership is based on similarities of interest on a particular issue. Considerable progress has been made in all important areas and if the states now negotiate on the hard issues, there can be a widely acceptable Law of the Sea Treaty in 1975. (Nursey-Florida)

TERRITORIAL SOVEREIGNTY AND THE PROBLEM OF TRANSNATIONAL POLLUTION,
G. Handl.
American Journal of International Law, Vol 69, No 1, p 50-76, 1975. 162 ref.

Descriptors: *International law, *Water pollution effects, *Legal aspects, *Penalties(Legal), *Australia, Pollutants, Water pollution sources, Path of pollutants, Pollutant identification, Water pollution control, Radioactivity, Radioactivity, effects, Nuclear explosions, Governmental interrelations, Foreign countries, Governments, Foreign waters, International waters.
Identifiers: *Territorial sovereignty, International Court of Justice(ICJ), Standing(Legal).

In a case concerning the legality of French atmospheric nuclear testing in the South Pacific currently before the International Court of Justice (ICJ), Australia has raised the issue that the deposits of radioactive fallout on the territory of Australia without Australia's consent violates Australian sovereignty over its territory. In the context of the aforementioned case, the legal rules applicable to situations involving activities which although lawful nonetheless produce environmental effects in territory of another state are discussed. After an examination of the pertinent case law and writings in the area, the following conclusions are made: (1) International law requires proof of material damage as a condition precedent to establishment of legal responsiblity on the part of the polluting state therefore state affected by transnational pollution c prevail with a claim based merely on a violati its sovereignty. (2) Material damage mu established as the direct consequence of an a transfrontier crossing of pollutants before a of action by the affected state against the pol state would arise. (Nursey-Florida)

STATE OF OHIO EX REL. BROWN V. CALLAWAY (ACTION BY STATE TO ENJOIN CONSTRUCTION OF TWO RESEARVOIRS).
497 F.2d 1235 (6th Cir June 6, 1974).

Descriptors: *Ohio, *Federal Water Pollution Control Act, *Construction, *Legal aspects, *Judicial decisions, Reservoirs, Legislation, Recreation, State governments, Social aspects, Aesthetics, Water law.
Identifiers: *Economic aspects, *Injunctive relief, *Standing, *Environmental impact statement.

An action was brought by the State of Ohio seeking to enjoin the Army Corps of Engineers from constructing two reservoirs. The district court entered an injunction, permitting limited construction despite the fact that the Army Corps of Engineers had failed to file an adequate environmental impact statement. The court also refused to allow certain conservation groups, property owners, and a contractors' association to intervene in the action. The Court of Appeals held the determination that the Army Corps of Engineers had failed to file an adequate environmental impact statement did not require an injunction against all activities. The district court may tailor the relief granted to the particular circumstances of the case. The appellate court also held that the applicants for intervention had an unconditional right to intervene under the Federal Water Pollution Control Act. (Sperling-Florida)

TOWN OF ISLIP V. POWELL (ACTION TO ENJOIN RENTING DOCK FACILITIES).
358 N.Y.2d 985 (Sup Ct Suffolk County 1974).

Descriptors: *New York, *Riparian rights, *Zoning, *Marinas, *Docks, Judicial decisions, Legal aspects, Planning, Local governments, Coastal structures, Navigable waters, Riparian land, Land use, Beds, Construction.
Identifiers: *Ordinances, *Submerged lands.

Plaintiff brought suit to enjoin marina operators from renting docking facilities on a portion of their marina, which extended from their adjacent residentially-zoned property. The court held that tidewaters are exempt from the State's jurisdiction over navigation, entitling the town to enforce its ordinance through injunctive relief. The court found that use of commercial docks in front of residentially-zoned property could not be seen as an extension of raparian rights, and not deserving of exemption from zoning restrictions. The town ordinance provided that underwater land shall be considered within the same zoning district as the abutting land for a distance of one hundred feet. Riparian owners have the right of access to navigable waters including the right to construct a dock. Those rights, however, are an extension of the rights of abutting land ownership and subject to the same limitations. (Sperling-Florida)

CITIZEN SUITS SPUR COURT PROBES OF ENVIRONMENTAL IMPACT.
Electrical World, Vol 177, p 28, May 1, 1972.

Descriptors: *Legal aspects, *Environmental effects, *Decision making, *Federal government, Administrative agencies, Adoption of practices, Project planning, Legislation, Judicial decisions, Legal review, Regulation, Administration, Law enforcement, Governments, Governmental interrelations.
Identifiers: *National Environmental Policy Act, Environmental impact statement, Private interests groups, Private enforcement.

The National Environmental Policy Act of 1969 requirement of environmental impact statement is court enforceable at the suit of interested citizens. The general counsel to the Council on Environmental Quality believes that citizen suits will lead to a rigorous probing of the environmental impact of government action. The Council views environmental laws as carrying with them a broad concept of standing to sue. In practice federal agencies submit statements on any project having some effect on the environment. Some officials have termed the process a procedural nightmare requiring vast amounts of paper and analysis. Another difficulty for agencies is when a unrealistic explanation of consequences and alternatives is required. A disputed issue is the extent to which courts should be relied upon to balance conflicting values. The prevalent seems to be that the function of weighting competing interests was placed in the hands of the agencies by Congress, and there it should remain. The main failing of the act so far has been the agencies' refusal to recognize its responsibility to consider environmental values at every stage leading to wasteful court review. (Sperling-Florida)

LEGAL MEASURES CONCERNING MARINE POLLUTION.
North Carolina State Univ., Raleigh.
Sea Grant Publication UNC-SG-75-04, February 1975. 83 p, 463 ref.

Descriptors: *North Carolina, *International law, *Water pollution, *Island, Oil, Grants, Projects, Water pollution effects, Research and development, Oil pollution, Water pollution control, Water pollution sources, Water quality control, Waste disposal, Legal aspects, International waters, Water law, Environmental effects, Law enforcement, Water resources development, Mineral industry, Waste dumps.
Identifiers: *Sea Grant projects.

This compilation of papers is a chronicle of new concepts and developments in marine pollution control. The articles presented were researched and written by students of International Laws at the University of North Carolina during the fall 1974 semester. One article discusses the use of the oceans as international disposal sites for industrial chemical waste materials. Another paper covers man-made islands and the relevant environmental objections to such structures, as well as legislation aimed at curbing pollution. Further, the use of man-made islands is considered in terms of feasibily for use in mineral extraction from the sea. In additionm probable cause requirements of the Fourth Amendment are explored in relation to vessel searches at sea. A new approach to pollution control on an international level is proposed.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Finally, controversies in pollution control created as a consequence of the trans-Alaskan pipeline are delineated. (See W76-00964 thru W76-00969) (Hoffman-Florida)

Identifiers: *Co-riparians, Coastal watsers, Hazardous substances(Pollution), International agreements.

The development of man's legal systems eemingly lags behind the advance of technology. This is exemplified by an international legal system which grants general license to exploit the seas with a technology that threatens to destroy the marine environment. Contemporary needs call for a shift from traditional concepts of sovereignty and freedom of the seas to a concept more protective of the marine ecosystem and coastal resources. One commentator suggests that the oceans be viewed as international rivers with all states sharing the rights and liabilities of co-riparians. The suggestion is based on the proposition that the seas are the common and co-equal territory of every state. Asserting claims against co-riparians for unreasonable use of the international rivers would be made possible through this special territoriality. Three cases dealing with the international application of this proposition are analyzed, and a definition of actionable pollution activity under this theory is proposed. Criteria for defining the injury, for determining possession of the protected interests, and for establishing objective standards are presented. Possible defenses to such actions are also explored. (See also W76-00463) (Hoffman-Florida)

Identifiers: *Artificial islands, *Deepwater ports.

With the realization that valuable mineral resources could be extracted profitably from the sea, part of the ocean's mystery disappeared. It became apparent that man-made islands offered great potential for mineral extraction. A brief history of two aborted attempts to form the islands of 'Taluga' and 'Abalonia' off the west coast near San Diego is presented. The purpose of these attempts was to form a base outside the territorial jurisdiction of the United States from which to harvest abundant supplies of lobsters and abalone. Some commentators opine that the law of the sea will have to answer the problem of dwindling land space, and permit some traditionally land based activities to be transferred to artificial islands. One marine science authority supports the view that offshore platforms are an economically feasible solution to population density and diminishing land space. Other proposed non-extractive uses of artificial islands include floating airports, floating oil storage tanks, and deepwater ports to accomodate supertankers. Jurisdictional problems which might arise regarding artificial islands are explored. (See also W76-00963) (Hoffman-Florida)

FOURTH AMENDMENT PROBLEMS IN THE ENFORCEMENT OF MARINE CONSERVATION LAWS,
North Carolina State Univ., Raleigh.
P. Stam, Jr.
In: Legal Measures Concerning Marine Pollution, Sea Grant Publication UNC-SC-75-04, p 45-55, February 1975. 53 ref.

Descriptors: *Law enforcement, *Penalties(Legal), *Federal jurisdiction, *Constitutional law, Regulation, Water law, Water policy, Water quality control, Legal aspects, Political aspects, International law, Jurisdiction, Law of the sea, Federal government, Governments, Political constraints, Ships, Water pollution sources, Boats, Environmental effects.
Identifiers: *Vessels, Searches, Probable cause, Hazardous substances(Pollution), Fourth amendment.

The effectiveness of anti-pollution and fishery conservation laws depends in part on the enforcement methods used. The application of the probable cause requirement of the Fourth Amendment to search of vessels at sea is explored. Generally, a warrant based on probable cause is required to search for evidence of a crime; but there are exceptions. It is suggested that a search of vessels at sea may fall within the logic of these exceptions. One exception provides that any person crossing an international border into the United States may be required to submit to a search, regardless of whether probable cause exists. The rationale for a border search is that one who crosses the border expects to be searched and explicitly consents to it. Similarly, it is arguable that a vessel search at sea is the functional equivalent of a border search. Further, a vessel search is compared to two other common exceptions to probable cause searches: administrative searches, and searches of a business affecting the public interest. Additionally, the international problems associated with searching foreign vessels are also explored. (See also W76-00963) (Hoffman-Florida)

INTERNATIONAL OCEAN DUMPING OF INDUSTRIAL CHEMICAL WASTE,
North Carolina State Univ., Raleigh.
P. B. Stam, Sr.
In: Legal Measures Concerning Marine Pollution, Sea Grant Publication UNC-SG-75-04, p 56-71, February 1975. 92 ref.

Descriptors: *Federal Water Pollution Control Act, *Waste dumps, *Industrial wastes, *Chemical wastes, *Waste disposal, Pesticide residues, Legislation, Federal jurisdiction, Aquatic habitats, Organic pesticides, Organic wastes, Water quality control, Water law, Penalties(Legal), Pesticide removal, Standards, Waste treatment, Waste water(Pollution), Wastes, Waste water treatment, Pesticides, Regulation.
Identifiers: Ocean Dumping Act, Marine environment, Administrative regulations, Effluent limitations, Hazardous substances(Pollution), Federal Water Pollution Control Act Amendments of 1972.

The use of the oceans for disposal of in chemical waste materials on an internatio is discussed. Legislation passed by the States Congress in 1972 regulates the dis wastes into the marine environment. goals include complete control over and li of the disposal of harmful materials oceans. Title I of the Ocean Dumping designed to regulate dumping both wit beyond the territorial jurisdiction of the States. Civil and criminal provisions are p for violators. The objective of the Federa Pollution Control Act Amendments of 19 eliminate the discharge of pollutants into n waters by 1985. The details of both the ab are explored. Environmental Protection criteria for granting open water dumping and related problems are explored. Finally method for disposing of persistent pesti analyzed. This technique involves high t ture incineration of chlorinated organic conducted at sea in ships specially equi carry out the combustion. (See also W7 (Hoffman-Florida)

J. C. Wyatt.
In: Legal Measures Concerning Marine P Sea Grant Publication, UNC-SG-75-04, February 1975. 68 ref.

Descriptors: *Alaska, *Canada, *Oil p *Water pollution control, Water pollution Oil industry, Oil fields, International law aspects, Jurisdiction, Oil spills, Oil was reservoirs, Legislation, International Pipelines, Water pollution sources, Wate tion, Water pollution treatment, Water Water Quality Act, Water quality control.
Identifiers: *Arctic waters, *Alaska Oil *Territorial jurisdiction, Hazardous stances(Pollution), International agreeme Pollution Act.

Discovery of the oil reserves of the North Alaska triggered the current interest a troversy regarding oil pollution control in tic. After years of litigation and despite the ical threats posed to the permafrost layer a wildlife, construction of the Trans-Alaska began in early 1974. As a result of the pip creasing attention has been focused on th waters. The efforts of the Canadian gover prevent future pollution culminated in the an Arctic Waters Pollution Prevention A comprehensive attempt to meet the thre types of water pollution in the Arctic. P concerning international jurisdiction of th waters are highlighted. Existing internati does not provide specific principles g ocean pollution. The present and future co sies concerning territorial jurisdiction of th waters demonstrate the need for an inter policy concerning ocean pollution (See al 00963) (Hoffman-Florida)

ces Council, *Implied reservation, Vested
Reserved use.

961, there have been major developments
er law regarding federal-state relations,
water use and regulation, and environmen-
rictions on federal water projects. The
iai Supreme Court applied the doctrine of
reservation in holding that the federal
nent has water rights where land under its
tion requires outside water sources. The
of adjucicating federal rights in state
as been eased by a 1971 Supreme Court
which held that the federal government
joined as a defendant to determine
as well as appropriated water rights. Sec-
of the Rivers and Harbors Act of 1970 al-
the no-compensation of navigational ser-
judicial doctrine by providing that a lan-
should be compensated for the highest and
of his property, including the value of
vigable waters. Litigation concerning the
groundwater users inter se has attempted
ate the common law rule that the overlying
ner has exclusive rights to subsurface
ith a reasonable use rule. Colorado has
several statutes dealing with groundwater
One requires a permit before appropriating
om a designated groundwater basin. When
or installation of wells poses a threat to
iate from related surface waters, its use
egulated. Several water conservation acts
in the 1960's have been applied by courts
re studies of adverse effects of water con-
ects, and regulations issued by the Water
es Council in 1973 should have a substan-
ct on state and local planning in this area.

DEFENSE COMMITTEE V. THIERMAN
UNDER NEPA TO COMPEL A
HEARING BEFORE ISSUING PER-

pp. 91 (S. D. New York 1974).

ors: *Judicial decisions, *New York,
*Administration, *Adoption of prac-
tices, Legal review, Regulation, Construction, Shoreline, Federal jurisdiction, Land reclamation, United States, Planning, Administrative agencies, Decision making, Water policy, Bulkheads.
Identifiers: *National Environmental Policy Act, *Injunctive relief, *Land ownership, *Statues.

An action was brought under the National Environmental Policy Act against the District Engineer of the United States Corps of Engineers. The Southern District Court of New York held that a hearing was necessary before issuing a permit for construction of a bulkhead and the placement of landfill shoreward for the purpose of building a family dwelling. The court also held that federal agencies must establish reviewable environmental records. The jurisdiction of a federal court under the National Environmental Policy Act extends only to review of compliance with congressional dictates and the agency's own regulations. Policy determinations are left to the expertise of the agency. (Sperling-Florida)
